The most conspicuous illustration of devitrification is the production of "Réaumur porcelain" from glass by the long-continued action of heat. (See *porcelain.*) The term *devitrification* is much employed by petrographers in describing the changes which have taken place in rocks consisting originally, either wholly or in large part, of glass. The term is sometimes incorrectly applied to primary crystallization in either natural or artificial glass, but should refer only to changes in a solid glass. It may have taken place in consequence of the action of water, either with or without the aid of heat, after the rocks had become solidified. Pressure is also regarded by many as being an agent of high importance. The changes thus indicated may be begun in a rock during its consolidation, and afterward continued under the combined influence of heat, water, and pressure, even to the entire obliteration of its original vitreous character, the result being the production of a purely lithoid structure. The devitrification of glassy rocks has often proceeded from perlitic cracks,

giving access to the solutions effecting the change. Lines representing these cracks may frequently be seen in thin sections under the microscope, even when devitrification is complete.

=Syn. *Devote, Dedicate, Consecrate, Hallow*, destine, set apart. In *dedicate* and the cognate words *devote, devout*, etc., the root idea is always that of a complete mental consecration; thus, *devotion* (def. 2) is the consecration of the entire mind to God and his worship; and a *devout* (def. 1) spirit is one entirely absorbed in the worship or service of God. To *devote* indicates the inward act, state, or feeling; to *dedicate* is to set apart by a promise, and indicates primarily an external act; to *consecrate* is to make sacred, and refers to an act affecting the use or relations of the thing consecrated; to *hallow* is to make holy, and relates to the character of the person or thing hallowed. Thus, we *devote* ourselves by an act of the mind; we *dedicate* our lives or property by a more formal act; we *consecrate* to sacred uses a building not before sacred; and we *hallow* the name of God, recognizing in it its inherent holy character.

It is white, insipid, and without smell, and is remarkable for the extent to which it turns the plane of polarization to the right hand, whence its name. Its composition is the same as that of starch. By the action of hot diluted acids, or of an infusion of malt, dextrine is finally converted into grape-sugar. It is used as a substitute for gum arabic in medicine and the arts. Also called *gommeline, moist gum, starch-gum, British gum*, and *Alsace gum*.

Dextrose is widely distributed, being found in most sweet fruits, grapes, raisins, cherries, etc., always associated with *l*-fructose. It also occurs sparingly in various animal tissues and juices, and in excessive quantity in diabetic urine. Dextrose is manufactured from starch in large quantity by the action of sulphuric acid. It is used for making cheap syrup, called glucose syrup, in the manufacture of beer, and for adulterating molasses. Now called *dextroglucose, grape-sugar*, and *starch-sugar*.—**Dirctatory dextrose.** See *birotation*.

di-[2]. [L., etc., *di-*, < Gr. *δι-*, two-, double, combining form of *δίς*, adv., twice, doubly (= L. *bis*, *bi-* = Skt. *dvi-* = E. *twi-*, etc.), < *δύο* = E. *two*: see *bi-*[2], *twi-*, *two*.] A prefix of Greek origin, cognate with *bi-*[2] (which see), and meaning 'two-,' 'twofold,' 'double,' as in *dipterous*, two-winged, *diptych*, a two-leaved tablet, *diarchy*, government by two, etc. In chemistry it denotes that a compound contains two units of the element or radical to which *di-* is prefixed: as, manganese *di*oxid, MnO_2, a compound of one atom of manganese and two of oxygen.

The form simulates Gr. *διάβασις*, a crossing over, < *διαβαίνειν*, go through or over, < *διά*, through, + *βαίνειν*, go: see *basis*.] The name originally given by A. Brongniart to a rock which Haüy later designated as *diorite*, which name Brongniart himself adopted in preference to that of *diabase*. Later (in 1842) Hausmann again introduced the word *diabase*, and by it designated a variety of pyroxenic rock, occurring in the Harz, and characterized by the presence of chlorite in considerable quantity. At the present time the name *diabase* is used to designate a crystalline-granular rock, consisting essentially of augite and a triclinic feldspar, with more or less magnetite or titaniferous iron, or both. Some authorities regard the ophitic texture (which see) as essential to diabase. The range in chemical composition is great, at one extreme being quartz-bearing varieties (= *quartz-diabase*), while at the other olivin becomes prominent (= *olivin-diabase*). The rocks to which the name 'diabase' was formerly applied were in most cases more or less decomposed and the common alteration product, chlorite, known also as *viridite*, was long considered to be an essential constituent. Diabase is one of the rocks included under the popular designation of *greenstone*, and also under that of *trap*.

The former is distinguished by the presence of an excessive quantity of sugar in the urine, and to it there is a strong tendency to restrict the name. Light and evanescent grades of glucosuria are not considered as diabetes, and doubtless frequently have an entirely different causation. The disease is chronic and generally fatal. Its essential pathology is unknown. It is not an affection of the kidneys, but depends upon the accumulation of sugar in the blood, or glucohemia. (See *glucosuria*.) Diabetes insipidus, or polyuria, is characterized by the discharge of abnormally large quantities of ordinary or watery urine.

by parallel lines drawn obliquely at equal distances across the parallels. Such a scale facilitates laying down small fractions of the unit of measurement. Thus, if, in the figure, the distance from 0 to 10—one inch—is divided into 10 equal parts, the diagonal which ends at 0 cuts off upon the parallel lines $\frac{1}{100}$, $\frac{2}{100}$, etc., inch respectively; the next diagonal cuts off $\frac{11}{100}$, $\frac{12}{100}$, etc.—**Diagonal triangle,** a triangle formed by the three diagonals of a complete quadrilateral, or the three diagonal points of a quadrangle.

2. One of a number of related modes of speech, regarded as descended from a common original; a language viewed in its relation to other languages of the same kindred; the idiom of a district or class, differing from that of other districts or classes. Thus, the Scotch is a dialect of English; English is a dialect of the Germanic or Teutonic group; Germanic speech is an Aryan or Indo-European dialect. Of the various dialects of Greek—Attic, Ionic, Doric, Æolic, and so on—the Attic finally became the common dialect of all cultivated Greeks. Every literary language is originally one of a body of related dialects, to which favoring circumstances have given vogue and general acceptance.

II. *n.* [= F. *dialectique* = Sp. *dialéctica* = Pg. *dialectica* = It. *dialettica* = G. Dan. Sw. *dialektik*, < L. *dialectica*, < Gr. *διαλεκτική* (sc. *τέχνη*), the dialectic art, the art of discussion, logical debate, also the logic of probabilities, fem. of *διαλεκτικός*, belonging to disputation: see I.] **1.** Logic, or a branch of logic; specifically, the art of critical examination into the truth of an opinion; inductive logic applied to philosophy; the logic of probable reasoning; the art of discussion and of disputation; logic applied to rhetoric and refutation. The invention of the art of dialectic is attributed to Zeno the Eleatic, whose arguments against motion are examples of the original meaning of the Greek word. The famous dialectic of Socrates and Plato, their chief instrument of philosophical inquiry, was a conversational discussion with inductive appeals to special instances. Dialectic was limited by Aristotle to logic accommodated to the uses of the rhetorician, appealing only to general belief, but not to first principles. The Stoics, who probably introduced the term *logic*, divided that art into rhetoric and dialectic, the former being the art of continuous discourse, the latter that of discussion with an interlocutor. Cicero and other Latin writers, influenced by Stoic doctrine, understand by dialectic "the art of discussing well" (*ars bene disserendi*). It thus became the name of that branch of the trivium of the Roman schools which we call logic, and retained that meaning throughout the middle ages. Hence, in all the earlier English literature, it is the synonym of *logic*, differing from that word only by a more distinct suggestion of the idea of disputation. Modern logicians have frequently restricted it to the doctrines of the Topics and Sophistical Elenchi, or to the former alone. It has also been used as a synonym of *syllogistic*. Kant named the constructive part of his Transcendental Logic *transcendental analytic*, and the destructive part *transcendental dialectic*. For the sake of this phrase, he makes dialectic, in general, the theory of fallacies. According to Hegel, each concept in the development of thought by a primitive necessity develops its own diametrical opposite, and to this reaction of thought against itself, regarded not as final, but as subject to a subsequent reconcilement in a higher order of thought, he gave the name of *dialectic*.

There hath not been, to my understanding, sufficiently inquired and handled the true limits and use of reason in spiritual things, as a kind of divine *dialectic*.
Bacon, Advancement of Learning, ii. 364.

We termed *Dialectic* in general a logic of appearance. This does not signify a doctrine of probability; for probability is truth, only cognized upon insufficient grounds, and though the information it gives us is imperfect, it is not therefore deceitful. *Kant*, tr. by Meiklejohn.

St. Paul, though bred in the *dialectic* of the Greek schools, came late by his conversion to the new faith, and remained a Jew to the last. *Alcott*, Table-Talk, p. 99.

It remains true that the value of the *Dialectic* which asks and gives such an account of ideal good as at once justifies and limits obedience to practical authorities is conditional upon its finding in the individual a well-formed habitual morality.
T. H. Green, Prolegomena to Ethics, § 328.

Diffusion immediately commences, the crystalloid passing through and dissolving in the water beneath, while the colloid remains behind. The process is commonly resorted to for the purpose of preparing pure colloids; but may also be used, as in toxicology, for separating crystalline substances, such as arsenic, corrosive sublimate, or alkaloid salts from a mass of organic colloids, which would prevent their detection by the usual tests.

diamagnetism (dī-a-mag′net-izm), *n.* [= F. *diamagnétisme;* as *diamagnet-ic* + *-ism.*] **1.** The phenomena exhibited by a class of substances which, when under the influence of magnetism and freely suspended, take a position with the longer axis at right angles to the magnetic lines of force. From the experiments of Faraday it appears to be clearly established that all matter is subject to the magnetic force as universally as it is to the gravitating force, arranging itself into two divisions, the *paramagnetic* and the *diamagnetic*. Among the former are iron, nickel, cobalt, palladium, titanium, and a few other substances; and among the latter are bismuth, antimony, cadmium, copper, gold, lead, mercury, silver, tin, zinc, and most solid, liquid, and gaseous substances. When a paramagnetic substance is suspended freely between the poles of a powerful horseshoe maguet, it points in a line from one pole to the other, which Faraday terms the *axial line*. On the other hand, when a diamagnetic substance is suspended in the same manner, it is repelled alike by both poles, and assumes an equatorial direction, or a direction at right angles to the axial line.

The magnetism of two iron particles lying in the line of magnetization is increased by their mutual action, but, on the contrary, the *diamagnetism* of two bismuth particles lying in this direction is diminished by their mutual action. *J. E. H. Gordon*, Elect. and Mag., II. 21.

If, however, the magnetism of the molecules were so much increased that they held each other tight, and so could not be turned round by ordinary magnetizing forces, it is shown that effects would be produced like those of *diamagnetism*. *W. K. Clifford*, Lectures, I. 241.

2. A precious stone, distinguished from all others by being combustible and by its extreme hardness, as well as by its superior refractive and dispersive power. It consists of pure or nearly pure carbon, leaving only a very small quantity of ash when burned. Its specific gravity is about 3½; its crystalline form is the isometric, and it cleaves readily in planes parallel to the faces of the regular octahedron. Natural crystals are found in a great variety of forms belonging to the isometric system. The crystalline planes of the diamond have this peculiarity, that they are frequently more or less convex, instead of being flat, as those of crystals usually are. The range of color of the diamond is extensive, but hues of light yellow, or straw-color, and brown are of most common occurrence. Diamonds of a decided color, such as green, blue, or even red, are found, but they are extremely rare; only one deep-red diamond is known. A diamond is of the *first water* when it is without flaw or tint of any kind. The value of the gem increases in an increasing ratio with its weight up to a moderate size; beyond that there is no fixed value. A first-water diamond of one carat being considered worth $100, one of two carats would be held at $300, and one of ten at $11,000. The most desirable form in which the diamond may be cut is called the *brilliant.* (See cuts under *brilliant.*) Diamonds formerly came chiefly from India, and later from Brazil; the present principal source of supply is southern Africa, where they are found associated with a peculiar rock of volcanic origin. In all other diamantiferous regions diamonds have been found only in the surface detrital material, or else, rarely, in rock of fragmental origin. See the supplement.

This rubbing is continued until each diamond assumes the proper outline, whether brilliant, rose, or briolette, the smaller facets being afterward made by polishing. Both stones are cut at the same time, irrespective of size or shape, or of the outline to be produced. Diamond-cutting is sometimes performed by machinery. (*b*) A ring, or a plate pierced with a circular hole so arranged as to fall in the axis of the instrument, used in optical instruments to cut off marginal beams of light, as in a camera or a telescope. 3. In *anat.*, the midriff; the musculomembranous partition which separates the thoracic from the abdominal cavity in mammals. In man the diaphragm consists of a muscular sheet whose fibers radiate from a trefoil tendinous center to attach themselves to the lower margins of the thorax, and behind form a large bundle on either side, called *pillars of the diaphragm.* The diaphragm is pierced by three principal openings: the *esophageal*, for the passage of the esophagus accompanied by the pneumogastric nerves; the *aortic*, for the passage of the aorta, thoracic duct, and large azygous vein; and the *caval*, for the inferior vena cava; besides some others for splanchnic nerves, etc. The diaphragm is invested on its thoracic surface by the pleural and pericardial serous membranes; on its abdominal surface by the peritoneum, a fold of which, reflected upon the liver, forms the suspensory ligament of that organ. The diaphragm is deeply concavo-convex, the convexity upward; the general figure is that of an umbrella. It is a powerful respiratory muscle, contracting at each inspiration and so flattening, while its relaxation in expiration renders it more convex; its contraction also assists in defecation and in parturition, and its spasmodic action is concerned in hiccough and sneezing; when most relaxed it rises to the level of about the fifth rib. A rudimentary diaphragm exists in birds; it is best developed in the apteryx.

diastem (dī'ạ-stem), *n.* [< LL. *diastema*, interval: see *diastema.*] Same as *diastema*, 2.

diastema (dī-ạ-stē'mạ), *n.*; pl. *diastemata* (-ma-tạ). [LL., an interval, esp. in music, < Gr. *διάστημα*, an interval, difference, < *διαστῆναι*, separate: see *diastasis.*] 1. In *zoöl.* and *anat.*, an interval between any two consecutive teeth, especially between any two series or kinds of teeth, as between the canines and premolars or incisors, or among the incisors, as in many bats. When there are no canines, as in rodents, diastema occurs between the incisors and the premolars. It necessarily occurs when opposing teeth are so long that they cross each other when the mouth is shut. Man is notable as having normally no diastemata, his teeth forming a continuous series, and being all of approximately equal lengths. But the same is the case with some other mammals, as in the genera *Tarsius* and *Anoplotherium.*

2. In *anc. Gr. music*, an interval. Also *diastem.*

diaster (dī-as'tėr), *n.* [< Gr. *δι-*, two-, + *ἀστήρ*, star.] In *biol.*, a double star; the karyokinetic figure which results when the daughter chromosomes move from the equator toward the poles of the spindle. See *aster* and *karyokinesis.*

A polar star is seen at each end of the nucleus-spindle, and is not to be confused with the *diaster.* *E. R. Lankester*, Encyc. Brit., XIX. 833.

diastimeter (dī-ạ-stim'e-tėr), *n.* [Prop. **diastasimeter*, < Gr. *διάστασις*, distance, interval (< *διστάναι*, *διαστῆναι*, stand apart), + *μέτρον*, a measure.] An instrument for measuring distances. *E. H. Knight.*

diastole (dī-as'tọ-lē), *n.* [LL., < Gr. *διαστολή*, dilatation, expansion, lengthening of a syllable, < *διαστέλλειν*, dilate, expand, put asunder: see *diastaltic.*] 1. The normal rhythmical dilatation or relaxation of the heart or other blood-vessel, which alternates with *systole* or contraction, the two movements together constituting pulsation or beating: as, auricular *diastole;* ventricular *diastole.* The term is also extended to some other pulsating organs, as lymph-hearts, and specifically to the expanding action of the contractile vesicle of infusorians and other protozoans.

2. The period or length of time during which a rhythmically pulsating vessel is relaxed or dilated; the time-interval which alternates with systole.—3. In *Gr. gram.*, a mark similar in position and shape to a comma, but originally semicircular in form, used to indicate the correct separation of words, and guard against a false division, such as might pervert the sense. Such a sign was needed to obviate the confusion arising from the ancient practice of writing without division between words. The diastole is still occasionally used, generally in order to distinguish the pronominal forms ὅ,τι and ὅ,τε, 'whatever, which,' from the particles ὅτι, 'that,' and ὅτε, 'when.' The usual practice at present, however, is to use a space instead of the diastole. When the present shape of the comma came into use, more or less confusion between it and the diastole necessarily ensued. Also called *hypodiastole.* See *hyphen.*

4. In *anc. pros.*, lengthening or protraction of a syllable regularly short; especially, protraction of a syllable preceding a pause or taking the ictus: as,

Ire negabamūs et tecta ignota subire.
Ovid, Metamorph., xiv. 250.

Most cases of diastole in Latin poetry are supposed to be instances of reversion to an older pronunciation, though the pause which usually follows could of itself make good the metrical deficiency. This reversion is seen chiefly in verb-terminations with final *t* and *r*: as,

Callidus ut soleät humeris portare viator.
Horace, Satires, I. v. 90.

As understood by recent naturalists, it is limited to *Diastylis* and *Leptostylis*; these have the integuments strongly indurated, body and tail sharply defined, and the carapace large and vaulted, with a conspicuous rostriform prominence.

Diatomaceæ (dī″ą-tō-mā'sē-ē), *n. pl.* [NL., < *Diatoma* + *-aceæ.*] A family of microscopic unicellular algæ, belonging to the class *Bacillarieæ*. They are characterized by having a silicification of the cell-wall and by the presence of a brownish pigment which conceals the green of the chlorophyl. The cells are either isolated or united into threads, etc., and often secrete a thin jelly in which they live socially. Each frustule is composed of two separate and similar parts (valves), the edges of which usually fit one over the other like the lid of a box. Reproduction takes place by division, by conjugation, and by spores formed within the cell. Diatoms exist in all parts of the world in immense numbers at the bottom of the sea and of fresh water, and are also found attached to the submerged parts of aquatic plants, etc., and among mosses and in other damp localities. There are many genera, and the number of known species exceeds 10,000. They vary greatly in the form and markings of the valves, which are often exquisitely sculptured, forming beautiful objects under the microscope and testing its highest powers. In some species the lines are found to equal 125,000 to the inch. Extensive fossil deposits of the silicious remains of *Diatomaceæ* occur in various localities, as at Bilin in Bohemia, and in Virginia, Nevada, and California. They are sometimes used as polishing-powder. They are abundant in guano. Preferably called *Bacillariaceæ*.

dichroism (dī′krō-izm), *n.* [< *dichro-ic* + *-ism.*] In *optics:* (*a*) A property possessed by many doubly refracting crystals of exhibiting different colors when viewed in different directions. Thus, palladium chlorid appears of a deep-red color along the axis, and of a vivid green when viewed in a transverse direction. Mica affords another example, being nearly opaque when viewed in one direction, but transparent and of a different color in another. This property is due to the difference in the absorption of the light-vibrations in the different directions. See *pleochroism.* (*b*) The exhibition of essentially different colors by certain solutions in different degrees of dilution or concentration.

See *color-variation.*

In Greek grammar the three vowel-letters *α*, *ι*, *υ*, which may be either long or short in sound, are called *dichronous*, in contrast to the four remaining vowel-letters, which are fixed in quantity (*ε* and *ο* always short, *η* and *ω* always long). (*b*) Consisting of two normal short times or moræ; disemic: as, a *dichronous* foot; lasting for the space of two times or moræ: as, a *dichronous* long (that is, an ordinary long, equal to two shorts, distinguished from a *trichronous* or other protracted long): as, a *dichronous* pause. On looking through the instrument the square hole appears double, the light which passes through being divided into two rays polarized in planes at right angles to each other; and if a dichroic crystal is placed in front of it, the two images, corresponding to the two sets of light-vibrations, will appear of different colors. A dichroscope may be combined with the polarizing apparatus of a microscope.

In the original and most usual sense a dictionary is chiefly linguistic and literary, containing all the common words of the language with information as to their meanings and uses. In addition to definitions, the larger dictionaries include etymologies, pronunciation, and variations of spelling, together with illustrative citations, more or less explanatory information, etc. Special or technical dictionaries supply information on a single subject or branch of a subject: as, a *dictionary* of medicine or of mechanics; a biographical *dictionary*. In a more elaborate form it is used to connect conversationally the various departments of a business establishment. [Trade-name.]

Dictum de omni et de nullo (concerning every and none), the rule of direct syllogism that if all A is B and all B is C, then all A is C. Some logicians render this as comprising two dicta: the *dictum de omni*, that whatever is true of all is true of each, and the *dictum de nullo*, that whatever is true of none is false of each. The canon is given by Aristotle.— **Dictum of Kenilworth**, an award designed for the pacification of the kingdom, made between King Henry III. of England and Parliament in 1266, during the siege of Kenilworth. Later the name *Dictyograptus* was improperly substituted for *Dictyonema*. This fossil has been considered by some as a plant, but is now referred to the graptolites, from which it differs but slightly, if at all. *Dictyograptus* (*Dictyonema*) is characteristic of the highest zone of the Cambrian in America and Europe and occurs also in both Silurian and Devonian formations.

Dictyophyllum (dik″ti-ọ-fil'um), *n.* [NL., < Gr. *δίκτυον*, net, + *φύλλον* = L. *folium*, leaf.] A genus of fossil ferns. It was established by Lindley and Hutton for certain palmate fronds with deeply pinnatifid pinnæ and confluent lobes which, in addition to the simple distinct primary nerve traversing each lobe, have a remarkable double system of nervation, consisting of larger meshes inclosing smaller ones, the whole bearing considerable resemblance to leaves of dicotyledonous plants. The annulate sporangia, arranged in very numerous minute sori, connect the genus with the *Polypodiaceæ*. *Dictyophyllum* is characteristic of the older Mesozoic, where it ranges from the base of the Rhætic to the top of the Jurassic.

Dictyophyton (dik-ti-of'i-ton), *n.* [NL., < Gr. *δίκτυον*, a net, + *φυτόν*, a plant.] The name given by Hall in 1863 to a group of fossils believed by him to be of algous nature but subsequently shown to be silicious hexactinellid sponges and referred to the family *Dictyospongidæ*, of which the genus *Dictyospongia* is the type. These sponges are characterized by their regularly reticulated skeleton, vertical silicious strands being crossed by transverse strands of like nature and the intermediate spaces or meshes filled with independent spicules of a great variety of shapes. They grew in extensive plantations and with extravagant expression of form in the Devonian seas, and Hall and Clarke have described 70 species from the Chemung formation alone. They continued in considerable abundance into the early Carboniferous seas. The first of these fossils discovered was described by Conrad as *Hydnoceras* under the impression that it was a cephalopod, and this name having priority is now employed in preference to the term *Dictyophyton*.

Dictyoptera (dik-ti-op'tę-rä), *n. pl.* [NL., < Gr. *δίκτυον*, a net, + *πτερόν*, a wing.] A group of cursorial orthopterous insects, the cockroaches, *Blattidæ* or *Blattina*, elevated to the ★rank of an order. *Leach*; *Burmeister*.

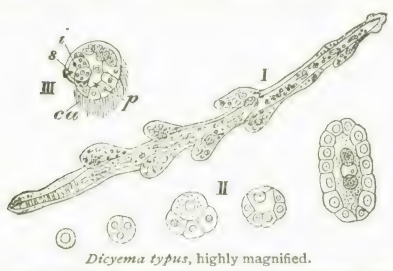
Because the reproductive bodies are non-ciliated and certain spores are divided into fours, they have been classed with the *Florideæ*. However, all their characters taken together indicate clearly that they are *Phæophyceæ*.



Dictyoteæ (dik-ti-ọ'tē-ē), *n. pl.* [NL., < Gr. *δικτυωτός*, netted, latticed, + *-eæ*. See *Dictyotaceæ*.] Same as *Dictyotaceæ*.

renchyma anastomose to form meshes which are occupied by parenchyma.

lium around the axial cell, the anterior of these, or polar cells, being distinguished from the succeeding or paraporal cells. The organism is a simple cell-aggregate, without connective, muscular, or nervous tissues. Reproduction takes place by the formation of germs on the axial cell. The embryos are of two different kinds, vermiform and infusoriform, whence the name. Those *Dicyemida* which give rise to the former kind are termed *Nematogena*, the others *Rhombogena*.

Dicyemida (dis-i-em'i-dä), *n. pl.* [NL., < *Dicyema* + *-ida.*] A division of animals proposed to be established by E. Van Beneden for the genus *Dicyema*, which has no mesoblastic layer, and is therefore regarded as intermediate between the *Protozoa* and the *Metazoa*.

Owen, Anat., I. 161.

Dicynodontia (dī-sin-ō-don'shi-ä), *n. pl.* [NL., pl. of *dicynodon(t-)*: see *Dicynodon.*] **1.** A suborder of extinct reptiles, probably of the Triassic period, remains of which have been found in Asia and Africa: a division of *Anomodontia.* Two of the genera, *Dicynodon* and *Oudenodon*, include lacertiform animals, sometimes of large size, with crocodilian vertebræ, four or five of which form a sacrum; with a massive skull, lacertilian in most of its characters, but with chelonian jaws, which were doubtless incased in a horny beak; and as a rule with two great tusks, one on each side of the upper jaw, deeply socketed in the maxilla, and growing from persistent pulps.

Didelphia (dī-del'fi-ä), *n. pl.* [NL., < Gr. *δι-*, two-, + *δελφύς*, womb. Cf. *Didelphys.*] The *Marsupialia* or marsupial implacental mammals; one of the three subclasses of *Mammalia*, the other two being *Ornithodelphia* and *Monodelphia.* They have no placenta, save in *Perameles*, and the womb is double, that is, the uterine dilatations of the oviducts continue through life distinct from each other, right and left, and open into two distinct vaginæ, which debouch in turn into a urogenital sinus, forming, with the termination of the rectum, a common cloaca embraced by the external sphincter muscle, and in the male lodging the penis, which thus appears to protrude from the anus. The female has usually an abdominal pouch or marsupium, formed by a fold of the skin of the belly, in which the mammary glands open, and into which the blind, naked, and imperfectly developed young are received and carried for some time hanging to the nipples. The scrotum of the male occupies a similar position. Both the marsupium and the scrotum are supported to some extent by the marsupial bones characteristic of this group, being ossifications in the tendon of the external oblique muscle of the abdomen, articulated with the pubes. A cremasteric muscle in relation with these bones acts in the female upon the mammary glands, effecting their compression, and consequently the flow of milk into the mouths of the helpless young. There are true teeth of two or three kinds. The coracoid is reduced to a process of the scapula, as in ordinary mammals, not reaching the sternum, as in monotremes. The corpus callosum is rudimentary or wanting, and the brain relatively small. The *Didelphia* are among the oldest known mammals, and formerly had an extensive range, but are now mainly confined to the Australian region, the American opossums offering the principal exception. Some of the extinct forms were of great size; the kangaroos are the largest living representatives. The marsupials are notable for their great physiological adaptation to all the modes of life of ordinary mammals, their structure being modified in relation to the carnivorous, the herbivorous, the rodent, and other habitudes, and their modes of progression and general economy being no less diverse. There is but one order, *Marsupialia* (which see).

Either to *die the death*, or to abjure
For ever the society of men.
Shak., M. N. D., i. 1.

=Syn. 1. *Die, Expire, Decease, Perish.* To *die* is to cease to live, part with life, or become dead from any cause, and under any circumstances; it is the plainest and most direct of the words. *Expire* is often used as a softer word than *die;* it means to breathe out the life or emit the last breath. *Decease* is a euphemism, like *expire*, but is often an affectation. *Perish* represents death as occurring under harsh circumstances of some sort, as violence or neglect; it emphasizes the idea of finality.

There taught us how to live; and (Oh! too high
The price for knowledge) taught us how to *die.*
Tickell, Death of Addison, l. 82.

One kiss the maiden gives, one last,
Long kiss, which she *expires* in giving.

That shared its shelter *perish* in its fall.
W. Pitt, Poetry of Anti-Jacobin, No. 36.

die[2]†, *v.* and *n.* An obsolete spelling of *dye*[1].

die[3] (dī), *n.*; pl., in the 1st sense, *dice* (dīs); in ★the remaining senses, *dies* (dīz). In def. 2 the word hardly admits of a plural. [The mod. sing. form *die* is due to the peculiar form of the pl., *dice*, ME. *dys*, etc. (see *dice*); the sing. would otherwise be **dce*, < ME. *dee*, a die, < OF. *de*, earlier *det*, pl. *dez*, F. *dé* = Pr. *dat* = Sp. Pg. It. *dado*, a die, cube, pedestal (whence E. *dado*, q. v.) (cf. ML. *dadus*, a die, after the Rom. forms), < L. *datum*, lit. what is given, but taken in the sense of 'what is cast or thrown,' neut. of *datus*, pp. of *dare*, give, in many phrases used as equiv. to 'cast' or 'throw' (cf. G. *würfel*, a die, < *werfen*, throw). Thus *die*[3] is a doublet of *date*[1], *datum*, and *dado:* see *date*[1].] **1.** A small cube marked on its faces with spots numbering from one to six, used in gaming by being thrown from a box or the hand, the chance being decided by the highest number of spots turned up, and in several other ways. The numbers on opposite faces of a die always add up to 7, but otherwise there is no uniformity in the arrangement of the numbers. The number of dice used is either one, two, three, or five, according to the game.

Roman Die, found in the south of France.

I have set my life upon a cast,
And I will stand the hazard of the *die.*
Shak., Rich. III., v. 4.

Before a cunning gamester.

Or to a tavern fine?

7. In *metal-working*, a bed-plate or disk having an opening in the center, used in a punching-machine to support the metal from which any piece is punched.—**8.** A knife by which blanks of any desired shape and size are cut out, as in the sole-shaped cutting-dies used in shoe-factories.—**Bit-brace die.** See *bit-brace.*—**Counter die,** an upper die or stamp.—**Loaded dice,** dice made heavier on one side than the others by the fraudulent insertion of a bit of lead, so that the highest number of spots shall be turned up when the dice are thrown in playing.

Professed gamblers . . . will not trust to the determination of fortune, but have recourse to many nefarious arts to circumvent the unwary; hence we hear of *loaded dice*, and dice of the high cut.
Strutt, Sports and Pastimes, p. 404.

Open-die machine, a screw-threading machine having movable cutting-dies fitting in blocks in the traveling die-head, thus saving time in fitting in different dies. An insertable steel block with a universal clinch to hold taps is provided for converting the machine quickly into a nut-tapper.—**The die is cast,** the affair is decided; the fate of the person or thing in question is settled; there is no recalling the act.—**The whole box and dice,** the ★whole number of persons or things. There are half a dozen species, of which two, *D. Seguine* and *D. picta*, are well-known decorative plants in greenhouses, varying exceedingly in the color and form of the foliage. The roots, as in many other plants of the family, are very acrid and caustic, and the name *dumb-cane* has been given to *D. Seguine* in the West Indies, from its effect upon the speech when its root is bitten.

II. *n.* A substance through or across which electric force is acting. The walls of a Leyden jar; the intervening medium, solid, liquid, or gaseous, between the plates of a condenser; and the insulating sheath around the conductor of a telegraph-cable, are examples of dielectrics. Electric induction across a dielectric causes a stress in it which, if great enough, will produce rupture. The maximum intensity of this stress which the material can bear is called its *dielectric strength.* When the dielectric strength of the air between two clouds, or between a cloud and the earth, is unable to withstand the electric forces, a flash of lightning takes place. The fracture of stones in buildings, of trees, etc., in a thunderstorm are illustrations of the effect of excessive dielectric stress.

Until this subject [induction] was investigated by Faraday, the intervening non-conducting body or *dielectric* was supposed to be purely negative, and the effect was attributed to the repulsion at a distance of the electrical fluid. Faraday showed that these effects differed greatly according to the *dielectric* that was interposed.
W. R. Grove, Corr. of Forces, p. 85.

Dielytra (dī-el'i-trạ), *n.* [NL., < Gr. *δι-*, two-, + *ἔλυτρον*, sheath, shard: see *elytrum.*] Same as *Dicentra.*

See *dialysis* and *distraction*, 8.—**2.** The sign (¨) regularly placed over the second of two contiguous vowels to indicate that they are pronounced separately; the same sign used for other purposes. The dieresis is used most frequently over *e* preceded by *a* or *o*, in distinction from the diphthongs or digraphs *æ* and *œ*. In Greek manuscripts these dots were frequently written over *ι* and *υ* beginning a word or a syllable, thus serving also to show that they did not form the close of a diph-

thong (αι, ει, οι, υι, αυ, ευ, ου), and their modern use is an extension of this. The employment of the dieresis to mark the full pronunciation of the letters *-ed*, as termination of the preterit and past participle (for instance, *praisëd*), though sometimes seen, is not established usage, the acute or grave accent being more common. A similar sign consisting of dots is used merely as a diacritical mark, as in the notation of pronunciation in this book (for instance, *ä, ö, ü*). A similar mark is used in German to indicate the umlaut. See *umlaut*.

[When in the predicate, *different* is either used absolutely: as, the two things are very *different*; or followed by *from*: as, the two things are very *different from* each other; he is very *different from* his brother. But the relation of opposition is often lost in that of mere comparison, leading to the use of *to* instead of *from*. This use is regarded as colloquial or incorrect, and is generally avoided by careful writers.

Different to is, essentially, an English colloquialism; and, like many colloquialisms, it evinces how much stronger the instinct of euphony is than the instinct of scientific analogy. *F. Hall*, Mod. Eng., p. 83.

See *interference.* Thus, if a

beam of monochromatic light is passed through a narrow slit and received on a screen in a dark room, a series of alternately light and dark bands or fringes is seen, which diminish in intensity and distinctness on either side of the central line; if white light is employed, a series of colored spectra of different orders is obtained. Similar phenomena of diffraction are obtained from diffraction gratings, which consist of a band of equidistant parallel lines (sometimes having 30,000 or more to the inch), ruled on a surface of glass or of polished metal; the spectra obtained by this means are called *interference* or *diffraction spectra.* They differ from prismatic spectra and are called *normal*, since in them the colors are distributed according to their wave-length; while in the latter the less refrangible (red) rays are crowded together, and the more refrangible (blue, violet) are dispersed. Diffraction gratings are now much used, especially in the study of spectra. The best gratings are ruled on speculum metal. Those with a concave surface (often called *Rowland gratings*, after Professor Henry A. Rowland of Baltimore) give an image of the spectrum directly, without the use of a lens.

diffusiometer (di-fū-si-om'e-tėr), *n.* [Irreg. < L. *diffusio(n-)*, diffusion, + *metrum*, a measure.] An apparatus devised by Graham for ascertaining the rate of diffusion between gases. It consists essentially of a tube, containing the gas under

experiment, with the lower end plunged in mercury and the upper end closed with a porous plug; the rate of diffusion is determined from the rapidity with which the mercury rises in the tube as the diffusion of the gas goes on through the porous plug.

diffusion (di-fū′zhọn), *n.* [= F. *diffusion* = Pr. *diffusio* = Sp. *difusión* = Pg. *difusão* = It. *diffusione*, < L. *diffusio(n-)*, < *diffundere*, pp. *diffusus*, diffuse: see *diffuse*, *v.*] The act of diffusing, or the state of being diffused. (*a*) The gradual and spontaneous mixing of two substances which are placed in contact one with the other. It takes place without the application of external force and even when opposed by the action of gravity. It is explained by the motion and mutual attraction of the particles of the substances. Diffusion is most rapid and marked between gases, but is also an important phenomenon of liquids. Diffusion of solids has likewise been observed, as when lead and gold have been left in contact with one another for a very long time. See *diffusion of gases* and *diffusion of liquids*, below.

The process of *diffusion* is one which is continually performing an important part in the atmosphere around us.
W. A. Miller, Elem. of Chem., I. iii. § 3.

(*b*) A scattering, dispersion, or dissemination, as of dust or seed, or of animals or plants.

The process of *diffusion* would often be very slow, depending on climatal and geographical changes, on strange accidents, and on the gradual acclimatization of new species to the various climates through which they might have to pass. *Darwin*, Origin of Species, p. 305.

(*c*) Propagation or spread, as of knowledge or doctrine.

Another measure of culture is the *diffusion* of knowledge. *Emerson*, Civilization, p. 21.

Diffusion of force, the phenomena of viscosity in moving fluids.—**Diffusion of gases**, the diffusion through each other which takes place when two bodies of gas are placed in contact, as when a bell-jar of hydrogen is placed base to base over one containing oxygen. After a certain time a homogeneous mixture is obtained, even if the heavier gas is placed below. When separated by a porous diaphragm the relative rate of diffusion can be measured (see *diffusiometer*); it is found to be the more rapid with the lighter gas.—**Diffusion of heat.** (*a*) A phrase employed to express the modes by which the equilibrium of heat is effected, viz., by conduction, radiation, and convection. The term is also used, like *diffusion of light* (see *light*), to describe the irregular reflection or scattering of the incident heat (and light) from the surface of a body not perfectly smooth. (*b*) Conduction of heat.—**Diffusion of liquids**, the diffusion through each other which occurs when two liquids that are capable of mixing, such as alcohol and water, are placed in contact, even in spite of the action of gravity. It is closely related to the phenomena of exosmosis and endosmosis (which see), which take place when the liquids are separated by a porous diaphragm. See also *dialysis*.—**Diffusion of taxes**, the theory that the community as a whole must bear the burden of any tax, no matter upon what commodity or persons it is originally levied. This theory rests on the assumption of perfect competition.—**Diffusion tube**, an instrument for determining the rate of diffusion for different gases.=**Syn.** Spread, circulation, expansion, dissemination, distribution.

It was a consonant, and appears to have had the force of the English *w*. It went out of use with the disappearance of the sound signified by it from Greek pronunciation, but is restorable on metrical and other evidence in many ancient Greek words, especially in Homer.

It. *digastrico*, < NL. *digastricus*, < Gr. *δι-*, two-, + *γαστήρ*, belly.] **I.** *a.* In *anat.*: (*a*) Having two fleshy bellies with an intervening tendinous part, as a muscle: as, the omohyoid, the biventer cervicis, etc., are *digastric* muscles. II. *n.* A muscle of the lower jaw: so called because in man it has two bellies. In its generalized condition it is a principal depressor of the lower jaw, opening the mouth and antagonizing the temporal and masseteric muscles. It arises from the back part of the skull, and is inserted into the mandible. In man and many other animals (though not in most) it becomes digastric or double-bellied, the intervening tendon being bound by an aponeurotic loop to the hyoid bone, and the muscle thus becoming an elevator of the hyoid as well as a depressor of the jaw. It arises from the digastric groove of the mastoid, and is inserted into the symphysis menti. With the lower border of the jaw its two bellies, which meet at an angle, bound the surgical triangle of the neck known as the submaxillary space.

(*d*) A strong close vessel, in which bones or other substances may be subjected, in water or other liquid, to a temperature above that of boiling. It is made of iron or other metal, with an air-tight lid, in which is a safety-valve. In this vessel animal or other substances are placed, and submitted to a higher degree of heat than could be obtained in open vessels, by which means the solvent power of the liquid is greatly increased. It is called in this form (first described in 1681) *Papin's digester*, from its inventor, Denis Papin, a Frenchman. The principle is applied in other forms, and by it various useful products are obtained on a large scale from animal carcases unfit for other use. In other kinds of digesters the operation is chemical, and does not imply the extreme pressures employed in that above described. Thus, in one kind, nut-galls or other vegetable products are placed in a vessel and saturated with ether; the volatile extract falls in minute drops into a closed vessel below, which is connected by means of a pipe with the top of the upper vessel to prevent the escape of the ether. See *rendering-tank*. Also *digestor*.

2. The physiological process of converting the food from the state in which it enters the mouth to that in which it can pass from the alimentary canal into the blood-vessels and lymphatics. The principal features of the process, apart from the comminution of the food, are the conversion of starch into sugar and of proteids into peptones, and the emulsionizing of the fats. These changes are effected by the action of soluble ferments furnished by the salivary glands, the gastric glands, the pancreas, and the intestinal glands. The bile is also of service, especially in the emulsionizing of the fats.

dilemma (di- or dī-lem′ä), *n.* [= F. *dilemme* = Sp. *dilema* = Pg. It. *dilemma* = D. G Dan. Sw. *dilemma*, ‹ LL. *dilemma*, ‹ Gr. *δίλημμα*, a conclusion from two premises, ‹ *δι-* + *λῆμμα*, a proposition, assumption: see *lemma*. Not "an argument in which the adversary is 'caught between' (*διαλαμβάνεται*) two difficulties," nor derived from *διαλαμβάνεσθαι*, be caught between.] 1. A form of argument in which it is shown that whoever maintains a certain proposition must accept one or other of two alternative conclusions, and that each of these involves the denial of the proposition in question. The alternatives are called the *horns of the dilemma*, which is also called a *horned syllogism*. The argument is also called a dilemma, in a looser sense, when the number of such horns exceeds two. The dilemma originated in rhetoric, and was not noticed by logicians before the revival of learning; consequently there has been some dispute as to its logical definition and analysis. The standard example (from Aulus Gellius) is as follows: Every woman is fair or ugly; it is not good to marry a fair wife, because she will flirt; it is not good to marry an ugly wife, because she will not be attractive; therefore, it is not good to marry at all. The essential peculiarity of this reasoning is that it involves the principle of excluded middle, the falsity of which would leave ordinary syllogism intact. Logicians, however, have made the dilemma a matter of form of expression, saying that the above argument, for instance, is not a dilemma as long as the first premise reads as above, but that it becomes one if that premise is put in this form: If it is good to marry, it is good to marry a fair wife, or it is good to marry an ugly wife. They have at different times recognized the following forms as dilemmas or as parts of dilemmas, for many logicians hold that a dilemma consists of three syllogisms: (1) *Simple constructive dilemma:* If A, then C; if B, then C; but either B or A; hence, C. (2) *Simple destructive dilemma:* If A is true, B is true; if A is true, C is true; B and C are not both true; hence, A is not true. (3) *Complex constructive dilemma:* If A, then B: if C, then D; but either A or C; hence, either B or D. (4) *Complex destructive dilemma:* If A is true, B is true; if C is true, D is true: but B and D are not both true; hence, A and C are not both true. The importance of the kind of reasoning now called *dilemma* was first strongly insisted upon by the Stoics. Nevertheless, in the Stoical terminology a *dilemma* is opposed to a *monolemma*, as a conclusion from two premises. This was the origin of the word, and it is only later that it is met with in the modern sense.

Dilemma is an argument made of two members, repugnant one to another, wherof which soever thou grantest, thou art by and by taken. *Blundeville*, Logic, v. 27.

diluvianism (di- or dī-lū′vi-an-izm), *n.* [< *diluvian* + *-ism*.] A geological theory which is largely based on the supposition of the former occurrence of a universal deluge. In the early history of geology the deluge played an important part, and many leading facts were explained by reference to it.

Linguistic philology has been actually created by it [the scientific movement of the age] out of the crude observations and wild deductions of earlier times, as truly as chemistry out of alchemy, or geology out of *diluvianism*. *Whitney*, Encyc. Brit., XVIII. 765.

diluviate† (di- or dī-lū′vi-āt), *v. i.* [< L. *diluviatus*, pp. of *diluviare*, overflow, deluge, < *diluvium*, a flood, deluge: see *diluvium*, and cf. *deluge*, *v.*] To overflow; run, as a flood.

E. *deluge*, q. v.), < *diluere*, wash away: see *dilute*.] **1.** A deluge or an inundation; an overflowing.—**2.** Coarse detrital material, wherever found: a term introduced into geology in consequence of a general belief in the past occurrence of a universal deluge. Finer materials, usually occupying the lower parts of valleys, and occurring especially along the courses of great rivers, were called *alluvium* (which see). In the use of the words *diluvium* and *alluvium* (*diluvial*, *alluvial*) there is an obscure recognition of a fundamental fact in geology, namely, that rivers have been gradually diminishing in volume, a condition which necessarily connects itself with diminished erosive power. But the idea of a catastrophic period of diluvial action, preceded and followed by repose, such as lies at the base of the belief in the deluge, is no longer in vogue. Diluvium was of chief importance before the nature of the glacial drift was understood.

dimaris, dimatis (dim′a-ris, -tis), *n.* [An artificial term.] The mnemonic name of that mood of the fourth figure of syllogism which has affirmative propositions for its premises, one universal, the other particular. The oldest name for this mood seems to have been *dimatis*, of which *dimatis* is an improvement, and *dimaris* is now most commonly in use. The following is an example of this mood: Some commendable actions are recognized by the political economists; but every action recognized by the economists is a selfish one; therefore, some selfish actions are commendable. The letters of the word have the following significations: *i*, *a*, and *i* show the quantity and quality of the propositions; *d*, that the reduction is to *darii*; *m*, that the premises are transposed in reduction; *s*, that the conclusion of the reduction is to be simply converted. See *A*[1], 2 (*b*), and *conversion*, 2.

Dimecodon (dī-mē′kō-don), *n.* [NL., < Gr. *δι-*, two-, + *μῆκος*, length, + *ὀδών*, Ionic for *ὀδούς* = E. *tooth*.] A notable genus of Japanese moles, of the family *Talpidæ*, related to *Urotrichus*, having teeth of two lengths (whence the name), and the anterior incisors broad and spatulate. The dental formula is: 3 incisors in each upper, 2 in each lower half-jaw, 1 canine, 3 premolars, and 3 molars in each half-jaw. The type-species is *D. pilirostris*, having the general aspect of *Urotrichus talpoides*; tail vertebræ half the length of the head and body, soles and palms entirely scaly, and snout pilose. Thus, a line has one dimension, length; a plane surface two, length and breadth; and a solid three, length, breadth, and thickness. The number of dimensions being equal to the number of principal axes, and that to the number of independent directions of extension, it has become usual, in mathematics, to express the number of ways of spread of a figure by saying that it has two, three, or *n* dimensions, although the idea of measurement is quite extraneous to the fact expressed. The word generally occurs in the plural, referring to length, breadth, and thickness.

> So doe those skils, whose quick eyes doe explore
> The just *dimension* both of earth and heaven.
> *Sir J. Davies*, Dancing, st. 95.
>
> A dark
> Illimitable ocean, without bound,
> Without *dimension*, where length, breadth, and highth,
> And time, and place, are lost. *Milton*, P. L., ii. 893.
>
> These as a line their long *dimension* drew,
> Streaking the ground with sinuous trace.
> *Milton*, P. L., vii. 480.

Hence—2. A mode of linear magnitude involved (generally along with others) in the quantity to which it belongs. (*a*) In *alg.*, a variable factor, the number of dimensions of an expression being the number of variable factors in that term for which this number is the largest. (*b*) In *phys.*, a linear measure of length, time, mass, or any kind of quantity regarded as a fundamental factor of the quantity of which it is a dimension. dimness (dim′nes), *n.* [<ME. *dimnes*, < AS. *dimnes*, < *dim*, dim: see *dim*, *a.*, and *-ness*.] The state of being dim or obscure; want of clearness, brightness, or distinctness; dullness; vagueness: applied either to the object or to the medium of vision or perception: as, the *dimness* of a view, of color, or of gold; the *dimness* of twilight or of the sky; *dimness* of vision, of understanding, memory, etc.

Answerable to this *dimness* of their perception was the whole system and body of their religion.
Decay of Christian Piety.

With such thick *dimness* of excited dust
In their impetuous march they fill'd the air.
Cowper, Iliad, iii.

Until his failing sight
Faints into *dimness* with its own delight.
Byron, Bride of Abydos, i. 6.

=Syn. *Obscurity*, *Gloom*, etc. See *darkness*.

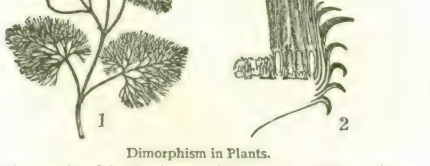
di molto (dē mōl′tō). [It., adv. phrase: *di*, < L. *de*, of; *molto*, < L. *multus*, much: see *multi-*.] In *music*, very much: as, allegro *di molto*, very fast.

dimorph (dī′môrf), *n.* [= F. *dimorphe* = It. *dimorfo* (chiefly adj.), < NL. *dimorphus*, < Gr. *δίμορφος*, having two forms, < *δι-*, two-, + *μορφή*, form.] One of the forms assumed by a dimorphous substance: as, calcite is a *dimorph*.

Dimorpha (dī-môr′fä), *n.* [NL., fem. of *dimorphus*: see *dimorph*.] 1. A genus of hymenopterous insects. *Jurine*, 1807.—2. A genus of mollusks. *Gray*, 1840.—3. A genus of birds. *Hodgson*, 1841.

dimorphic (dī-môr′fik), *a.* [As *dimorph* + *-ic*.] 1. Existing in two distinct forms; dimorphous. See *dimorphous*.

A large proportion of the trees of temperate climates bear only flowers thus *dimorphic*. *Nat. Hist. Rev.*



2. Pertaining to dimorphism; exhibiting or characterized by dimorphism, in any sense of that word.

Dimorphic females among insects have been observed. . . . In these cases, as a rule, one of the female forms is more nearly related in form and color to the male, . . . in other cases the differences are more connected with climate and season, and also affect the male.
Claus, Zoölogy (trans.), I. 155.

★ **dimorphism** (dī-môr′fizm), *n.* [= F. *dimorphisme* = It. *dimorfismo*; as *dimorph* + *-ism*.] 1. The property of assuming or of existing under two distinct forms. Specifically—2. In *crystal.*, the property of assuming two distinct crystalline forms not derivable from each other, as by crystallization. Thus, sulphur assumes one form when crystallizing at a high temperature, and another wholly different when becoming solid at the ordinary temperature. Hence, the same chemical substance may form two or more distinct mineral species. Carbon in one form is the diamond, in another graphite, etc.

According to the observation of Pasteur, instances of *dimorphism* usually occur when the two forms are nearly upon the limit of their respective systems.
W. A. Miller, Elem. of Chem., I. iii. § 4.

3. In *bot.*, the occurrence of two distinct forms

Dimorphism in Plants.
1. Submerged and floating leaves of *Cabomba*. 2. Disk- and ray-florets of *Aster*.

of flowers or other parts upon the same plant, or upon plants of the same species.

Dimorphism in flowers may affect the perianth only, and not the γονή or essential organs; or there may be two kinds of flowers as respects these also, but with no reciprocal relations, as in cleistogamous *dimorphism*; or of two kinds essentially alike except in stamens and pistil, and these reciprocally adapted to each other, which is heterogonous *dimorphism*, or, when of three kinds, trimorphism. *A. Gray*, Struct. Bot., p. 225.

4. In *zoöl.*, difference of form, structure, size, coloration, etc., between individuals of the same species. Sexual dimorphism is the rule in the animal kingdom; and differences between the male and female other than in the sexual organs, as well as constant differences between individuals of each sex, without reference to sex, are instances of dimorphism.

Dimorphism is thus seen to be a specialized result of variation, by which new physiological phenomena have been developed. *A. R. Wallace*, Nat. Select., p. 158.

The phenomena of *dimorphism* and polymorphism in the same species, and the sexual differences which have been developed in animals originally hermaphrodite, may be quoted as important evidence of the extensive influence of adaptation. . . . The numerous cases of *dimorphism* and polymorphism in either sex of the same species should be regarded from the same point of view.
Claus, Zoölogy (trans.), I. 154.

5. In *philol.*, the existence of a word under two or more forms called doublets; thus, *dent* and *dint*, *fat* and *vat*, *church* and *kirk*, exhibit *dimorphism* developed within English, and *card* and *chart*, *choir*, *quire*, and *chorus*, *reason*, *ration*, *ratio*, etc., exhibit *dimorphism* arising outside of English.

Where it [bifurcation] is produced by a foreign word coming into English in different ways, it has been called *dimorphism*: ration, reason.
F. A. March, Anglo-Saxon Grammar, p. 28.

Dimorphodon (dī-môr′fō-don), *n.* [NL., < Gr. *δίμορφος*, of two forms (see *dimorph*), + *ὀδών*, Ionic form of *ὀδούς* (*ὀδοντ-*) = E. *tooth*.] A genus of extinct pterosaurian reptiles, or pterodactyls: so called from the fact that their teeth were of two kinds, the anterior long, the posterior mostly very short. The tail was long, and the other characters mostly as in *Rhamphorhynchus*; the metacarpus was comparatively short, and the first digit of the wing represented by a styliform bone. From the Lias.

dimorphous (dī-môr′fus), *a.* [< NL. *dimorphus*, < Gr. *δίμορφος*, having two forms: see *dimorph*.] Existing in two forms; dimorphic: specifically applied in crystallography to a substance whose crystals occur in two distinct forms. Thus, calcium carbonate crystallizes in the rhombohedral form as calcite, and in the orthorhombic as aragonite. See *dimorphism*.

Bodies capable of . . . assuming two forms geometrically incompatible are said to be *dimorphous*.
W. A. Miller, Elem. of Chem., I. iii. § 4.

It is not unlikely that the Guinea worm, . . . which infests the integument of Man in hot climates, may answer to the hermaphrodite state of a similarly *dimorphous* Nematoid. *Huxley*, Anat. Invert., p. 552.

The principal meal of the day, taken at midday or later, even in the evening. In medieval and modern Europe the common practice, down to the middle of the eighteenth century, was to take this meal about midday, or in more primitive times even as early as 9 or 10 A. M. In France, under the old régime, the dinner-hour was at 2 or 3 in the afternoon; but when the Constituent Assembly moved to Paris, since it sat until 4 or 5 o'clock, the hour for dining was postponed. The custom of dining at 6 o'clock or later has since become common, except in the country, where early dinner is still the general practice. See extract under *dinner-hour*.

The Court *dinner-hour*, in the reign of George III., was at the Hanoverian hour of four o'clock. During the reign of George IV. it gradually crept up to six o'clock, and finally became steady at the Indian hour of seven, and so remained until the reign of Her Most gracious Majesty, when the formal Court *dinner-hour* became eight o'clock. These innovations on the national hours of meals did not meet the approval of the medical faculty, and in consequence a dinette at two o'clock was prescribed. This has ever since been the favourite Court meal, being in reality a substantial hot repast, which has exploded the old-fashioned luncheon of cold viands.

Dinosauria (dī-nō-sâ'ri-ą), *n. pl.* [NL., less prop. *Deinosauria*, < *Dinosaurus*, q. v.] A group of extinct Mesozoic reptiles, mostly of gigantic or colossal size. They were characterized by usually socketed teeth; generally flat or slightly cupped vertebræ, some of which were opisthocœlous; a sacrum of four or more vertebræ; numerous caudal vertebræ; a structure of the skull in many respects intermediate between the crocodilian and lacertilian types; ambulatory or saltatory limbs; fore limbs reduced and not known to have had clavicles; and hind limbs usually disproportionately developed, and with the pelvis presenting a series of modifications tending toward the characters of birds, on which account the group is also called *Ornithoscelida* (which see). The ornithic structure of the legs is best seen in the smaller genera, such as *Compsognathus*; it is exhibited in the presence of a cnemial crest, the reduction of the distal end of the fibula, the disposition of the distal end of the tibia, and the relations of the astragalus. In some genera there was a bony dermal armor, in some cases developing great spines. The *Dinosauria* were a polymorphic as well as an extensive group, the limits of which are not settled, owing to the wide range of variation presented by them. They ranged in size from that of the huge iguanodon down to about two feet. By some they are supposed to have included the remote ancestors of birds; others find in them features that recall mammals, especially pachyderms. The order is by some divided into *Dinosauria* proper and *Compsognatha* (which see). The *Dinosauria* are sometimes ranked as a subclass of *Reptilia*, and divided into *Sauropoda*, *Predentata*, and *Theropoda*.

Plays were performed during this festival, and from its characteristic songs and jests comedy was developed. The Greater Dionysia were observed at Athens in the second half of March, with a grand procession, a set chorus of boys, and the production in competition at the expense of the state, in the Dionysiac theater, in honor of the god, of the comedies and tragedies of which those surviving constitute our most precious treasures of ancient literature. Διόφαντος, a proper name, + *-ine*[1].] Of or pertaining to Diophantus of Alexandria, a celebrated Greek arithmetician, who flourished in the fourth century.—**Diophantine analysis,** indeterminate analysis: a method of solving Diophantine problems, namely, of solving indeterminate algebraic equations, the solutions being rational numbers. The method consists in introducing an equation involving an indeterminate coefficient, in such a way that the square of one of the unknowns may be eliminated. It therefore depends upon the ingenuity and experience of the calculator. The following is an example: Required to separate a given square number, N^2, into the sum of two squares. Let x^2 be one of these squares, and let the root of the other be $ax - N$, where a is indeterminate. Then, the sum of the two squares will be $(1 + a^2)x^2 - 2aNx + N^2$. Since this is equal to N^2, we have $(1 + a^2)x = 2aN$, or $x = 2aN/(1 + a^2)$, which is rational.

Section of Fresnel's Dioptric Light.

II. *n.* A unit of refractive power of a lens (or inverse focal length), equal to unity divided by a meter. The numerical measure of the power of a lens expressed in dioptrics is the ratio of one meter to the focal length of the lens, the latter being measured positively in the direction away from the source of parallel rays entering the lens; so that a convex lens with a focal length of half a meter would have a power of 2 dioptrics, and a concave lens with a focal length of 250 millimeters would have a power of −4 dioptrics.

Owing principally to differences in the length of the inch in various countries, this method [the inch being used as the unit] had great inconveniences, and is now giving place to a universal system, in which the unit is the refractive power of a lens whose focal length is one metre. This unit is called a *dioptric* (usually written "D"). *Encyc. Brit.*, XXII. 373.

dioptrical (dī-op′tri-kal), *a.* Same as *dioptric*.

dioptrically (dī-op′tri-kal-i), *adv.* By refraction.

A spectacular painting, or a connected series of paintings, intended for exhibition to spectators in a darkened room, in a manner to produce by optical illusions an appearance of reality. The paintings are so executed and arranged that a variety of effects may be induced by varying the direction, intensity, and color of the light; one of the most notable of these effects coming from light transmitted through the picture itself, which is painted in transparent coloring on a thin fabric. Different scenes may be painted on the two faces of the fabric, and a change from one to the other may be made by altering the source of the illumination. A daylight scene may be thus changed with wonderful realism to one by moonlight, or a desert place may become all at once peopled by a busy crowd. The diorama was devised in 1822 by Daguerre (the chief inventor of photography) and Bouton.

Diorite consists essentially of a crystalline-granular aggregate of soda-lime feldspar and hornblende, or mica, in very varying proportions. Rocks containing hornblende are often called *diorite proper;* those with mica, *mica-diorite*. Some petrographers distinguish diorite from diabase through the composition of the feldspar contained in them, those rocks with strongly sodic plagioclase being called *diorite* and those with highly calcic feldspars being called *diabase*. In this view there may be augite-diorites. At the silicious end of the series is *quartz-diorite*, known also as *tonalite*.

Flower and Fruit of Persimmon (*Diospyros Virginiana*).

Of the 150 species, only two are American, of which one is the common persimmon of the United States, *D. Virginiana*, sometimes called *date-plum*. The wood is hard and heavy, and many species yield woods that are valuable for carving, furniture-making, etc. Ebony is the heart-wood of several species, the best and most costly, with the blackest and finest grain, being obtained from *D. tesselaria* of Mauritius and *D. Ebenum* of Ceylon. *D. quæsita* of Ceylon yields calamander-wood, and *D. Kurzii* the marble-wood of the Andaman islands. *D. Kaki*, the Chinese or Japanese persimmon, is cultivated for its fruit, which resembles the plum in texture and flavor, and has been introduced into southern Europe and the United States. *D. Lotus* of southern Europe has been supposed to be the lotus of the ancients, but its fruit is hardly eatable. It is used as a remedy for diarrhea. The fruits of most of the species are exceedingly astringent when immature, owing to the amount of tannic acid which they contain.

It is not infrequently followed by more or less extended paralysis. The air-passages of the head are the most frequent seat of the diphtheritic membrane, although it may appear on other mucous surfaces and in wounds. The disease is very frequently fatal. It is due to the presence of a special micro-organism, the *Bacillus diphtheriæ* or Klebs-Loeffler bacillus.

diphthong (dif′- or dip′thông), *n.* [Formerly also *dipthong*; = F. *diphthongue* = Pr. *diptonge* = Sp. *diptongo* = Pg. *diphthongo*, *ditongo* = It. *dittongo* = D. *diphthongus* = G. *diphthong* = Dan. In uttering a proper diphthong both vowels are pronounced; the sound is not simple, but the two sounds are so blended as to be considered as forming one syllable, as in *joy*, *noise*, *bound*, *out*. An "improper" diphthong is not a diphthong at all, being merely a collocation of two or more vowels in the same syllable, of which only one is sounded, as *ea* in *breach*, *eo* in *people*, *ai* in *rain*, *eau* in *beau*. (See *digraph*.) In Greek grammar, a proper diphthong is a diphthong the first vowel of which is short; an improper diphthong, a diphthong the first vowel of which is long. The proper diphthongs are *αι*, *ει*, *οι*, *αυ*, *ευ*, *ου*; the improper, *ᾱι*, *ηι*, *ωι* (commonly written *ᾳ*, *ῃ*, *ῳ*: see *iota subscript*, under *subscript*), *ηυ*, *ωυ*. An improper diphthong not usually distinguished as such is *ᾱυ*, as in *νᾱῦς*, Epic *νηῦς*. Some include *υι* in this class, and some limit the term to *ᾳ*, *ῃ*, *ῳ*.

Whether there were any true *diphthongs* in Old-English, and if not, when they were introduced, is a question which cannot now be answered.

diphyzoöid (dif-i-zō′oid), *n.* [< Gr. *διφυής*, of double form (see *Diphyes*), + *zoöid.*] A reproductive zoöid of the oceanic hydrozoans of the order *Calycophora*, detached and free-swimming by means of its nectocalyx, representing the complex distal set of appendages. Also *diphyozoöid*.

The distal set of appendages [in the calycophorans] is the oldest, and, as they attain their full development, each set becomes detached, as a free-swimming complex *Diphyzoöid*. In this condition they grow and alter their form and size so much that they were formerly regarded as distinct genera of what were termed monogastric Diphydæ.

After some hours of rest the protoplasm of each spore escapes from its cell-wall, acquires cilia, and enters upon a period of active movement.

Diplarthrism appears in that foot before it does in the fore foot, as in the Proboscidia.
E. D. Cope, Amer. Nat., XXI. 988.

diplarthrous (dip-lär'thrus), *a.* [< NL. *diplarthrus*, < Gr. *διπλόος*, double, + *ἄρθρον*, joint.] Doubly articulated, as a bone of one row of carpal or tarsal bones with two bones of the other row; characterized by or exhibiting diplarthrism; not taxeopodous: as, a *diplarthrous* carpus or tarsus; a *diplarthrous* ungulate mammal.

The diplasic class of feet comprises those feet in which the thesis or metrically accented part (called by many the arsis) has double the length of the arsis or metrically unaccented part (called by many the thesis). The diplasic feet are (1) the trisemic feet (equal to ⏑ ⏑ | ⏑ or ⏑ | ⏑ ⏑), the tribrach, trochee, and iambus, and (2) the hexasemic feet (equal to ⏑ ⏑ ⏑ ⏑ | ⏑ ⏑ or ⏑ ⏑ | ⏑ ⏑ ⏑ ⏑), the Ionic a majore, the Ionic a minore, Molossus, and choriamb.

It consists of an equilateral hollow prism, two of whose sides are silvered on the inside so as to be mirrors, while the third is formed of glass. The prism is adjusted so that one of the silvered sides shall be exactly in the plane of the meridian, and the transparent side toward the object. So long as the object has not reached the meridian, the image produced by that portion of the rays reflected directly from the glass surface, and that produced by the rays transmitted through the glass to the silvered side, reflected from it to the other, and thence through the glass, are not coincident, but gradually approach as the sun or star approaches the meridian, until they exactly coincide at the instant the center of the object is on the meridian; then an eye stationed at the side of the prism and looking toward the transparent side sees only one object.

The terms contraplex and *diplex* are here applied as specific names for designating clearly the way in which the particular simultaneous double transmission to which we wish to refer is effected. Thus, for instance, two messages may be sent over a single wire in the same or in opposite directions, and when we do not care to particularize either, we simply allude to them under the more common generic name of duplex transmission, which includes both. When, however, we wish to speak of either method by itself, we use the term *diplex* for simultaneous transmission in the same direction, and contraplex for that in opposite directions. *G. B. They have both branchial and pulmonary respiration, whence the name; no distinct suspensorium is developed, but the lower jaw articulates directly with descending processes of the cranium; there is a median pelvic element; and the limbs are multiarticulate. The skeleton is partially osseous, with persistent notochord; the heart has two auricles and one ventricle; there is a muscular conus arteriosus and spiral intestinal valve; the gills are free, with a narrow opening and rudimentary gill-cover; and the air-bladder is nearly or quite double, and developed into functional lungs permanently communicating with the esophagus. The body is covered with cycloid scales. The living *Dipnoi* are divisible into two groups, *Dipneumona* with paired lungs, and *Monopneumona* with a single lung of two symmetrical halves. Some old extinct relations are referred to another order (or suborder) called *Ctenodipterini,* by others endowed with the rank of a family only. See *barramunda, Ceratodidæ, Ctenodipterini, Dipteridæ, Lepidosirenidæ, mudfish,* and *Sirenoidea.* Also called *Diplopnoi, Dipneusta, Dipneusti, Dipnoa.*

It is a remarkable circumstance, that while the *Dipnoi* present in so many respects a transition between the piscine and the amphibian types of structure, the spinal column and the limbs should be not only piscine, but more nearly related to those of the most ancient Crossopterygian Ganoids than to those of any other fishes.

They are two-winged insects, or flies, with two membranous wings with radiating nervures, not folded at rest, a posterior pair being only represented by halteres or poisers; no mandibles as such, but a suctorial proboscis instead, formed of modified mandibles, maxillæ, and the central labium, here called glossarium; usually two maxillary but no labial palpi; antennæ generally short; two large compound eyes, often of thousands of facets, and three ocelli or simple eyes; and the prothorax and metathorax reduced, the mesothorax being correspondingly developed. Metamorphosis is complete; the larvæ are apodal, or with only rudimentary feet; the pupæ are usually coarctate (see cut under *coarctate*), sometimes obtected. The common house-fly, bluebottle, etc., are characteristic examples. The power which many of these insects have of walking on smooth surfaces with back downward is due to the construction of the feet, which act as suckers. They have, besides the ordinary two claws, several little cushions called pulvilli, beset with fine hairs expanded at their tips into a kind of disk; the adhesion is aided in some cases by a viscid secretion of these hairs. The order is a very large one: there are said to be 9,000 European species alone, supposed to be not a twentieth part of the whole number. About 4,000 are described as North American. A few are useful scavengers, but many are injurious insects, and some are great pests. Gnats, mosquitos, gad-flies, blow-flies, bot-flies, tzetzes, etc., belong to this order. It is variously subdivided, one division being into four suborders: the *Pupipara*, which are parasitic, and developed in the body of the parent, as the bee-lice; the *Brachycera*, or ordinary flies; the *Nemocera*, or crane-flies, gnats, midges, mosquitos, etc.; and the wingless *Aphaniptera*, or fleas, which are oftener ranked as a distinct order. Another division is into the suborders *Orthorhapha* and *Cyclorhapha*, according to the character of the metamorphosis: the former with two sections, *Nematocera* and *Brachycera;* the latter with also two sections, *Aschiza* and *Schizophora*.

The recitation of the name of any prelate or civil ruler in the diptychs was a recognition of his orthodoxy; its omission, the reverse. The mention of a person after death recognized him as having died in the communion of the church, and the introduction of his name into the list of saints or martyrs constituted canonization. In liturgics the diptychs are distinguished as *the diptychs of the living* and *the diptychs of the dead*, the latter including also the commemoration of the saints. In most liturgies the diptychs are included in the *great intercession* (see *intercession*). direct-action (di-rekt'ak″shọn), *a.* In *mech.*, characterized by direct action: a term applied to engines which have the piston-rod or cross-head connected directly to, or by a connecting-rod with, the crank, dispensing with working-beams and side levers: as, a *direct-action* steam-engine. A rectilinear motion of the piston is insured by a cross-head at the end of the piston-rod, which slides in parallel guides, or, in the case of the oscillating engine, the cylinder vibrates in accordance with the movement of the crank. Special types of direct-action engines are the annular double-cylinder, double-piston, inclined-cylinder, inverted-cylinder, oscillating, sliding-cover, steeple-, and trunk-engines. Also applied to steam-pumps which have the steam-piston connected by the piston-rod directly to the pump-piston or plunger, and which have valve-gear that prevents stopping at either end of the stroke. Such pumps work without cranks or fly-wheels.

Sw. *direktion*, < L. *directio*(*n*-), a making straight, a straight line, a directing (toward anything), < *dirigere*, pp. *directus*, direct: see *direct*.] **1.** Relative position considered without regard to linear distance. The direction of a point, A, from another point, B, is or is not the same as the direction of a point, C, from another point, D, according as a straight line drawn from B through A and continued to infinity would or would not cut the celestial sphere at the same point as a straight line drawn from D through C and also continued to infinity. Every motion of a point has a determinate direction; for if any motion from any instant were to lose all curvature, it would tend toward a determinate point of the celestial sphere, which would define its direction at the instant when it ceased to be deflected. It is inaccurate to say that a line has a determinate direction, because a motion along that line has either one of two opposite directions. Yet the word *direction* is sometimes used in a loose sense in which, opposite directions not being distinguished, the direction of a line is spoken of, meaning the pair of opposite directions.

The *direction* of a star is seen at a glance, while the most profound science and the most accurate observations have not enabled the astronomer to ascertain its distance.

directly (di-rekt'li), *adv.* **1.** In a straight line or course, literally or figuratively; in the natural and primitive way: as, aim *directly* at the object; gravity tends *directly* to the center of the earth. In mechanics a body is said to strike or impinge directly against another when the stroke is in a direction perpendicular to the surface at the point of contact. Also, a sphere is said to strike directly against another when the line of direction passes through both their centers. The principal ecclesiastical directories are: (1) The set of rules drawn up in 1644 by the Westminster Assembly of Divines, to take the place of the Book of Common Prayer of the Church of England, ratified by Parliament in 1645, and adopted by the Scottish General Assembly the same year. In impregnated eggs, even when freshly laid, the germ-disk may be resolved by moderate magnifying power into a flattened mass of little cells which have already arisen by this form of cleavage of the original parent-cell or discocytula, and have become a discomorula, or even advanced to the stage of a discoblastula or discogastrula.—**Discoidal epipleuræ,** in *entom.*, borders of the elytra which are strongly deflexed, appearing like processes of the lower surface of the disk. *Kirby.*—**Discoidal nervures,** in *entom.*, the nervures in the center of the wing, entirely unconnected with other nervures, as in certain *Coleoptera.*—**Discoidal placenta,** a placenta or afterbirth which has the form of a circular flattened cake, as that of man, monkeys, bats, insectivores, and the ★rodents.

Most jelly-fishes belong to this order. They are technically characterized as *Scyphomedusæ* which develop as sexual medusiform individuals by transverse fission from a scyphistoma (which see), or else directly from the egg; with 4 perradial, 4 interradial, and sometimes accessory adradial tentaculicysts; 4 or 8 genital lobes developed from the endoderm forming the oral floor of the enteric cavity, which is extended into 4 or 8 pouches; and with the mouth either opening simply at the end of a rudimentary manubrium or provided with 4 or 8 arm-like processes. According to the character of the mouth, the *Discomedusæ* are divided into three suborders, *Cannostomæ, Semostomæ*, and *Rhizostomæ.* To the last of these belongs the genus *Cephea.* (See cut under *Discophora.*) The order as here defined is contrasted with the three orders *Stauromedusæ, Peromedusæ*, and *Cubomedusæ*, and is included with them in the class *Scyphomedusæ.* Characteristic genera of discomedusans are *Linerges* and *Nausithoë* among the simple cannostomous forms; the semostomous *Chrysaora, Pelagia, Cyanea*, and *Aurelia*; and the rhizostomous *Cephea, Cassiopeia*, and *Pilema.* The term *Discomedusæ* has also been wrongly extended to other scyphomedusans, thus becoming synonymous with the subclass *Scyphomedusæ*, or with *Discophora* in one of its senses.

3. In *math.* See the extract.

The term *discontinuous*, as applied to a function of a single variable, has been used in two totally different senses. Sometimes a function is called *discontinuous* when its algebraic expression for values of the variable lying between certain limits is different from its algebraical expression for values of the variable lying between other limits. Sometimes a function of x, $f(x)$, is called continuous when, for all values of x, the difference between $f(x)$ and $f(x+h)$ can be made smaller than any assignable quantity by sufficiently diminishing h, and in the contrary case *discontinuous*. If $f(x)$ can become infinite for a finite value of x, it will be convenient to consider it as *discontinuous* according to the second definition. *Stokes.*

Discophora (dis-kof′ō-rä), *n. pl.* [NL., neut. pl. of *discophorus*: see *discophorous*.] **1.** The discoidal hydrozoans, a subclass of *Hydrozoa*, comprising most of the organisms known as jelly-fishes, sea-jellies, or sea-nettles. The latter name is given them from the power they possess, like other hydrozoans, of stinging by means of their thread-cells. The hydrosome consists of a single umbrella-like disk, by the rhythmical contraction of which the creature swims, and from the center of which hangs a single polypite or digestive individual, or, less frequently, several. They are free-swimming oceanic animals, whose body consists of such soft gelatinous substance that a specimen weighing several pounds when alive weighs when dried hardly as many grains. The *Discophora* include many acalephs, in the usual sense of that term, and are also called *Medusæ*, *Ephyromedusæ*, and *Acraspeda*. They have been divided into *Calycozoa* (lucernarians), *Rhizostomea*, and *Monostomea*. The term *Discophora* is also restricted to the last two of these, excluding the *Lucernarida*. Thus, by Claus, the *Discophora* are made a suborder of *Scyphomedusæ*, synonymous with *Acraspeda*, and characterized as disk-shaped acalephs with the margin of the disk 8-lobed, at least 8 submarginal sense-organs, as many ocular lobes, and 4 great cavities in the umbrella for the generative organs. In this strict sense the *Discophora* correspond to the *Discomedusæ* (which see). For several wider and inconsistent uses of the term, see the extract.

Cephea, one of the *Discophora*.
a, disk, or umbrella; *b*, ramifications of the brachia which terminate in *c*, the tentacles; *O*, pillars supporting the brachiferous disk which floors the subumbrellar cavity; *i*, short clavate tentacles between the oral pores.

The binary division of the Hydrozoa was established by Eschscholtz (1829), whose Discophoræ phanerocarpæ correspond to the Scyphomedusæ, whilst his Discophoræ cryptocarpæ represent the Hydromedusæ. The terms point to distinctions which are not valid. In 1853 Kölliker used the term *Discophora* for the Scyphomedusæ alone, an illegitimate limitation of the term which was followed by Louis Agassiz in 1860. Nicholson has used the term in a reverse sense for a heterogeneous assemblage of those medusæ not classified by Huxley as Lucernaridæ, nor yet recognized as derived from hydroid trophosomes. This use of the term adds to the existing confusion, and renders its abandonment necessary. . . . The term *Discophora* is used by Claus for the Discomedusæ. *Encyc. Brit.*, XII. 556.

G. *disconto* = Dan. *diskonto* = Sw. *diskont*), < ML. *discomputus*, discount; from the verb: see *discount*, *v.*] **1.** An allowance or deduction, generally of so much per cent., made for prepayment or for prompt payment of a bill or account; a sum deducted, in consideration of cash payment, from the price of a thing usually sold on credit; any deduction from the customary price, or from a sum due or to be due at a future time.—**2.** In *finance*, the rate per cent. deducted from the face value of a promissory note, bill of exchange, etc., when purchasing the privilege of collecting its amount at maturity. *Bank discount* is simple interest paid in advance, and reckoned, not on the sum advanced in the purchase, but on the amount of the note or bill. This is the method recognized in business and in law. *True discount* is a technical term for the sum which would, if invested at the same rate, amount to the interest on the face value of the note or bill when due: thus, $5 is the bank discount at the rate of 5 per cent. on a bill drawn at twelve months for $100; while $4.7619 is the true discount, because that sum if invested at 5 per cent. would at the end of a year amount to $5. True discount may be found by multiplying the amount of a bill or note by the rate of discount and dividing by 100 increased by the rate; while bank discount is computed in the same manner as simple interest.

3. The act of discounting: as, a note is lodged in the bank for *discount*; the banks have suspended *discounts*.—**4.** In *billiards*, an allowance made by a superior to an inferior player of a deduction of one count from his string for every count made by the latter. A *double discount* deducts two counts for one; *three discounts*, three; and so on up to the *grand discount*, which deprives the player who discounts his opponent (gives the odds) of all prior counts whenever the latter makes a successful shot.—**At a discount**, below par; hence, in low esteem; in disfavor.

3. In *optics*, the separation of the different colored rays in refraction, arising from their different wave-lengths. The point of dispersion is the point where refracted rays begin to diverge. When a ray of sunlight is made to pass through prisms of different substances, but of such angles as to produce the same mean deviation of the ray, it is found that the spectra formed are of different lengths. Thus, the spectrum formed by a prism of oil of cassia is found to be two or three times longer than one formed by a glass prism; the oil of cassia is therefore said to disperse the rays of light more than the glass, or to have a greater dispersive power. It is also found that in spectra formed by prisms of different substances the colored spaces have to one another ratios differing from the ratios of the lengths of the spectra which they compose; and this property has been called the *irrationality of dispersion* or of the colored spaces in the spectrum. See *prism* and *refraction*.

Dispersion has been accounted for by the different speeds of light of different wave-lengths in the same refracting medium. *Tait*, Light, § 72.

The lower end of the distaff was held between the left arm and the side, and the thread, passing through and gaged by the fingers of the left hand, was drawn out and twisted by those of the right, and wound on a suspended spindle made so as to be revolved like a top, which completed the twist. In Eastern countries and in some districts of Europe, especially in Italy, the primitive distaff and spindle are still used; but after the introduction of the spinning-wheel into Europe, about the fifteenth century, the distaff became an attachment only of that designed for flax, and thus continued in general use till a recent period, modified in form.

2. The volatilization and subsequent condensation of a liquid by means of an alembic, a still and refrigeratory, or a retort and receiver; the operation of obtaining the spirit, essence, or essential oil of a substance by the evaporation and condensation of the liquid in which it has been macerated; rectification; in the widest sense, the whole process of extracting the essential principle of a substance. The most common method of conducting the process of distillation consists in placing the liquid to be distilled in a boiler of copper or other suitable material, called the *still*, having a movable head from which proceeds a coiled tube called the *worm*, which passes through water constantly kept cold. Heat being applied to the still, the liquid in it is volatilized, and rises in vapor into the head of the still, whence, passing down the curved tube or worm, it becomes condensed by the cold water, and makes its exit in a liquid state. The object of distillation is to separate volatile liquids from non-volatile liquids and solid matters, and also, by the operation called *fractional distillation* (which see, below), to separate from each other volatile liquids which have different boiling-points. The process is used in the arts, in the manufacture of alcohol and spirituous liquors, for preparing essences and essential oils, and for a great variety of other purposes.

The typical and leading genus of the family *Distomidæ;* a genus of trematoid or suctorial parasitic worms, or flukes, of which *D. hepaticum*, the liver-fluke, is the best-known. *D. hepaticum* is oftenest found in the liver of sheep, in which it causes the disease called rot, but it also occurs in man and various other animals. In form it is ovate, flattened, and presents two suckers (whence the name), of which the anterior is perforated by the oral aperture, and the posterior median one is approximated to it; there is a complicated branched water-vascular system; the intestine is branched and without an anus. It has been shown that the ciliated embryo passes into *Limnæus truncatulus*, and there gives rise to a sporocyst which develops rediæ, which produce other rediæ, or cercariæ, which are tadpole-like larvæ; these after swimming for a time become encysted, as, for example, on blades of grass, and in this state are eaten by sheep. Numerous species of the genus are described. *D. hæmatobium*, from the veins of man, is now referred to the genus *Bilharzia*. See cut under *cercaria*.

The group includes the families *Distomidæ* and *Monostomidæ*.

In some States the term is applied to a class of towns. Perhaps ult. connected with *dip*, q. v. The mod. pret. is prop. *dived*, but the pret. *dove*, after the assumed analogy of *drove* from *drive* (cf. *strove* for earlier *strived*, pret. of *strive*), is common in colloquial speech, and is found in good literary use.] **I.** *intrans.* **1.** To descend or plunge head first into water; thrust the body suddenly into water or other fluid; plunge deeply: as, to *dive* for shells.

Provide me (Lord) of Steers-man, Star, and Boat,

There are three leading species: the great northern diver, *Colymbus torquatus*; the black-throated diver, *C. arcticus*; and the red-throated diver, *C. septentrionalis*. All three inhabit the northern hemisphere generally, and are noted not only for their quickness in diving, but also for the length of time they remain and the distance they traverse under water, in which they move both by swimming with the feet and by paddling with the wings. See *loon*. Also *diving-bird*.

2. One who plunges into or engages deeply in anything.—**Cartesian diver.** See *Cartesian*.

3. To differ from a typical form; vary from a normal state or from the truth.—**4.** In *math.*, to become larger (in modulus) without limit: said of an infinite series when, on adding the terms, beginning with the first, the sum increases indefinitely toward infinity. Amer. Jour. Philol., V. 494.

3. In *math.*, the negative of the scalar part of the result of operating with the Hamiltonian operator upon a vector function. It is so called because if the vector function represents displacements of the parts of a fluid, the divergence represents the decrement of density at any point due to this displacement.—**Angle of divergence.** See *angle*[3].

Divergent parabola, a name given by Newton to a cubic parabola or cubic curve having the line at infinity as its inflexional tangent.—**Divergent rays**, rays which, proceeding from a point of a visible object, continually depart from one another in proportion as they recede from the object: opposed to *convergent rays*. Concave lenses render parallel rays divergent, convex lenses convergent.—**Divergent series**, an infinite series such that, if we begin adding the terms together in their order, we do not ultimately approximate indefinitely toward a finite limit, but either oscillate from one value to another or move toward infinity. Only in the latter case, according to the usage of mathematicians, is a divergent series said to diverge. Thus, for instance, the infinite series $1-1+1-1+1-1+1$ is *divergent* without diverging.—**Divergent strabismus.** See *strabismus*.—**Divergent wings**, in *entom.*, wings which in repose are horizontal but spread apart, receding from the abdomen, as in many flies.

It. *diverso*, < L. *diversus*, various, different, also written *divorsus*, pp. of *divertere*, *divortere*, turn or go different ways, part, separate, divert: see *divert*. According to modern analogies, the word *divers* would be written *diverse* (pron. dī'vėrs); association with the F. original favored the spelling *divers*; and this form, with the plurality involved in the word, caused it to be regarded as a plural (whence the pron. dī'vėrz). Hence in mod. speech *divers* is used only with a plural noun. It is now obsolete or archaic, the form *diverse*, regarded as directly from the L., having taken its place. In earlier use *divers* and *diverse* are merely different spellings of the same word; early quotations are therefore here all put under *divers*. See *diverse*.] **1†.** Different in kind, quality, or manner; various.

Divine assistance. See *assistance*.—**Divine office**, the stated service of daily prayer; the canonical hours.—**Divine right.** (*a*) *Of kings*, the doctrine that the king stands toward his people *in loco parentis*, deriving his authority, not from the consent of the governed, but directly from God. This doctrine, which in English history was especially developed under the Stuarts, though still held by some as a matter of theory, has generally ceased to have practical political significance.

> The *Divine right of kings*, independent of the wishes of the people, has been one of the most enduring and influential of superstitions, and it has even now not wholly vanished from the world. *Lecky*, Europ. Morals, II. 285.

(*b*) *Of the clergy*, a claim of divine authority for particular persons and particular forms of ecclesiastical government. An instance in the Roman Catholic Church is the still unsettled claim of the bishops to power in their several dioceses, as opposed to the papal theory that they rule mediately through the pope.—**Divine service**, the public worship of God; especially, the stated or ordinary daily and Sunday worship; in the Roman Catholic and Anglican churches, the hours or the daily morning and evening prayer, and the celebration of the eucharist.—**Tenure by divine service**, in *Eng. law*, an obsolete holding, in which the tenants had to perform certain religious services, as to sing a specified number of masses, expend a certain sum in alms, etc.—**The divine remedy** (*divinum remedium*), the root of *Imperatoria ostruthium*, or masterwort, which was formerly highly esteemed in medicine, but seems to have few virtues except those of an aromatic stimulant.=**Syn. 2.** Holy, sacred.—**3.** Supernatural, superhuman.

The *divineress* ought to have no perturbations of mind, or impure passions, at the time when she was to consult the oracle; and if she had, she was no more fit to be inspired than an instrument untuned to render an harmonious sound. *Dryden*, Plutarch.

diving-beetle (dī′ving-bē″tl), *n.* A popular name for various aquatic beetles of the family *Dytiscidæ*. They swim freely in the water, and may often be seen diving rapidly to the bottom, whence their name. See cut under *Dytiscus*.

diving-bell (dī′ving-bel), *n.* A mechanical contrivance consisting essentially of an inverted cup-shaped or bell-shaped chamber filled with air, in which persons are lowered beneath the surface of the water to perform various operations, such as examining the foundations of bridges, blasting rocks, recovering treasure from sunken vessels, etc. Diving-bells have been made of various forms, such as that of a bell, or a hollow truncated cone or pyramid, with the smaller end closed and the larger one, which is placed lowermost, open. The air contained within the bell prevents it from being filled with water on submersion, so that the diver may descend in it and breathe freely, provided he is furnished with a new supply of fresh air as fast as the contained air becomes vitiated by respiration. The diving-bell is now generally made of cast-iron in the form of an oblong chest (A), open at the bottom, and with several strong convex lenses set in its upper side or roof, to admit light to the interior. It is suspended by chains from a barge or other suitable vessel, and can be raised or lowered at pleasure, in accordance with signals given by the persons within, who are supplied with fresh air injected into a flexible pipe by means of a forcing-pump (B) placed in the vessel, while the vitiated air escapes by a cock in the upper part of the bell. An improvement on this form, called the *nautilus*, enables the occupant, instead of depending upon the attendants above, as in the older forms, to raise or sink the bell, move it about at pleasure, or raise great weights with it and deposit them in any desired spot.

Diving-bell.

diving-bird, *n.* Same as *diver*[1], 1 (*b*).

diving-dress (dī′ving-dres), *n.* Submarine armor (which see, under *armor*).

diving-spider (dī′ving-spī″dėr), *n.* An aquatic spider, *Argyroneta aquatica*, which builds its nest under water, and habitually dives to reach it, carrying down bubbles of air, with which it fills its nest on the principle of the diving-bell. It is thus enabled to remain under water, though fitted only for breathing air. See cut under *Argyroneta*.

diving-stone (dī′ving-stōn), *n.* A name given to a species of jasper.

divining-rod (di-vī′ning-rod), *n.* A rod or twig used in divining; especially, a twig, generally of hazel, held in the hand and supposed by its bending downward to indicate spots where metalliferous deposits or water may be found by digging. It is usually made of two twigs of hazel, or of apple or some other fruit-tree, tied together at the top with thread, or of a naturally forked branch, and is grasped by both hands in such a way that it moves when attracted by the sought-for deposit. This method of searching for ore or water has been in use for centuries, but its efficacy is now rarely credited by intelligent persons.

Shall we have most likelihood of success if we dig from east to west, or from west to east?—or will you assist us . . . with your *divining-rod* of witches-hazel?

As applied to matter, the term implies properly that any portion of matter may, by the exercise of sufficient force, be separated into parts. After the general acceptance of the Daltonian theory of atoms, the term *infinite divisibility of matter* was long retained with the meaning of the infinite divisibility of space.

The geometricians (you know) teach the *divisibility* of quantity *in infinitum*, or without stop, to be mathematically demonstrable. *Boyle*, Things above Reason.

I said at first that *infinite divisibility of matter* was the doctrine now in vogue amongst the learned, but upon second thoughts I believe I have misrepresented them, and the mistake arose from want of distinguishing between *infinite* and indefinite *divisibility*.
A. Tucker, Light of Nature, III. iii. § 12.

divisible (di-viz′i-bl), *a.* and *n.* [= F. *divisible* = Sp. *divisible* = Pg. *divisivel* = It. *divisibile*, < LL. *divisibilis*, divisible, < L. *dividere*, pp. *divisus*, divide: see *divide*.] **I.** *a.* **1.** Capable of division; that may be separated or disunited; consisting of separable parts or elements: as, a line is *divisible* into an infinite number of points.

Dan. Sw. *division*, < L. *divisio(n-)*, division, < *dividere*, pp. *divisus*, divide: see *divide*.] **1.** The act of dividing or separating into parts, portions, or shares: as, the *division* of a word (as by means of a hyphen at the end of a line); the *division* of labor; the *division* of profits.

Specifically—(*a*) [L. *divisio(n-)*, tr. of Gr. διαίρεσις.] In *logic*, the enumeration and naming of the parts of a whole; especially, the enumeration of the species of a genus. The latter is also distinguished as *logical division*. *Division* is mainly distinguished from *classification* in that the latter is a modern word, and supposes minute observation of the facts, while the former, as an Aristotelian term, denotes a much ruder proceeding, based on ordinary knowledge, and undertaken at the outset of the study of the genus divided. One of the distinctive doctrines of the Ramist school of logicians was that all division should proceed by dichotomy.

Division is a dividyng of that whiche is more commune into those whiche are lesse commune. As a definicion therefore dooeth declare what a thing is, so the *division* sheweth how many thinges are conteined in the same.
Sir T. Wilson, Rule of Reason (1551).

Division is the parting or dividing of a word or thing that is more generall, unto other words or things lesse generall. *Blundeville*, Arte of Logicke (1599), ii. 3.

(*b*) In *her.*, the separating of the field by lines in the direction of the bend, the bar, etc. (called *division bendwise,*

barwise, etc.), also for the purpose of impaling two shields together, or in quartering. (*c*) The separation of members in a legislative house in order to ascertain the vote. This is effected in the British House of Commons by the passing of the affirmative and negative sides into separate lobbies, to be counted by tellers; in American legislatures, by their rising alternately, or, as is frequently done in the House of Representatives, by passing between tellers standing in front of the Speaker's desk. In the British House of Commons the usual method of voting on any contested measure is by division; in the United States, by ayes and noes, or affirmative and negative answers on a call of the roll.

The motion passed without a *division*. *Macaulay.*

2. In *math.*: (*a*) The operation inverse to multiplication; the finding of a quantity, the quotient, which, multiplied by a given quantity, the divisor, gives another given quantity, the dividend. In elementary arithmetic division is often defined as, for example, "the partition of a greater summe by a lesser" (*Recorde*, 1540); but such a definition applies only when the quotient is an abstract number and an integer. Division is denoted by various signs. Thus, *a* divided by *b* may be written in any of the following ways:

$$a \div b, \quad \frac{a}{b}, \quad a/b, \quad a:b, \quad ab^{-1}.$$

Where multiplication is not commutative (that is, where xy is not generally equal to yx) there are two kinds of division; for if $xy = z$, x may be regarded as the quotient of z divided by y, or y as the quotient of z divided by x. These two kinds of division are denoted as follows:

$$xy \div y = x, \quad \frac{xy}{x} = y, \quad xy/y = x, \quad xy:y = x, \quad x^{-1}(xy) = y.$$

Division is one of the fundamental operations in arithmetic, common algebra, and quaternions; but in other forms of algebra it generally gives an indeterminate quotient, and so loses its importance. (*b*) A rule or method for ascertaining the quotient of a divisor into a dividend: as, long *division*. (*c*) A section; the separation of a geometrical figure into two parts.—**3.** The state of being divided; separation of parts: as, an army weakened by *division*; *divisions* among Christians.

Hate is of all things the mightiest divider; nay, is *division* itself. *Milton*, Divorce, ii. 21.

4. That which divides or separates; a dividing line, partition, or mark of separation; any sign or cause of separation or distinction.

5. A part separated or distinguished in any way from the rest; a minor part or aggregate; a distinct portion: as, the *divisions* of an orange; a *division* of mankind or of a country; the *divisions* of a book or of a discourse.

Express the heads of your *divisions* in as few and clear words as you can. *Swift.*

Specifically—(*a*) A definite part of an army or of a fleet, consisting of a certain number of brigades or of vessels under a single commander.

For his *divisions*, as the times do brawl,
Are in three heads. *Shak.*, 2 Hen. IV., i. 3.

(*b*) A part of a ship's company set apart for a certain service in action. Those who serve at the guns are classed as the *first*, *second*, *third*, and *fourth divisions*; the *powder division* provide the guns with ammunition; the *master's division* steer the ship and work the sails; and the *engineer's division* manage the engines and the boilers. (*c*) A geographical military command, consisting of two or more departments. Thus, the Military Eastern Division consists of the department of the East, the department of the Gulf, and the Panama Canal Zone; the Central Division, of the Lakes, the Missouri, and Texas. In the military organization of the United States there are at present 4 divisions, viz.: the Eastern, Central, Western, and Philippines divisions, which embrace 10 departments, the Panama Canal Zone, and military reservations. See *department*. (*d*) In *nat. hist.*: (1) In zoölogical classification, any group of species forming a part of a larger group: in entomology, sometimes specifically applied to a group smaller than a suborder and larger than a family, as the division *Gymnocerata* of the *Heteroptera*. A *section* may be equivalent in value to a division, or a group subordinate to it; a *series* is a division in which the minor groups show a regular gradation in structure. (2) In botanical classification, one of the higher grades in the sequence of groups, equivalent to *subkingdom* or *series*, as the phænogamous and cryptogamous *divisions* of plants. It is also often used as subordinate to *class*, as the polypetalous, apetalous, etc., *divisions* of dicotyledonous plants. By some authors it has been used to designate a grade between *tribe* and *family*.

6. The state of being divided in sentiment or interest; disunion; discord; variance; difference.

Are they not sign and symbol of thy *division* from Him?
Tennyson, The Higher Pantheism.

7. In *music*, a rapid and florid melodic passage or phrase, usually intended to be sung at one breath to a single syllable: so called because originally conceived as the elaboration of a phrase of long tones by the division of each into several short ones. It was common in the music of the eighteenth century.

Sweet as ditties highly penn'd,
Sung by a fair queen in a summer's bower,
With ravishing *division*, to her lute.
Shak., 1 Hen. IV., iii. 1.

Music, advance thee on thy golden wing,
And dance *division* from sweet string to string.
Middleton, Blurt, Master-Constable, i. 1.

Now that the manager has monopolized the Opera-house, haven't we the signors and signoras calling here, sliding their smooth semibreves, and gargling glib *divisions* in their outlandish throats?
Sheridan, The Critic, i. 1.

8. The precise statement of the points at issue in any dispute. [Rare.]

The *devision* is an openyng of thynges wherein we agree and rest upon, and wherein we stick and stand in travers, shewing what we have to saie in our owne behalfe.
Sir T. Wilson, Rhetoric (1553).

The terms are still further divided, each into two parts; and, after *division* in the Michaelmas and Lent terms, a student who can assign a good plea for absence to the College authorities may go down and take holiday for the rest of the time. *C. A. Bristed*, English University, p. 87.

Accidental division, a division of a subject according to its accidents: as, good things are, according to Aristotle, either qualities of mind, qualities of body, or accidents of fortune.—**Centesimal division.** See *centesimal*.—**Complementary division**, a method of division given by Boëthius. The smallest round number larger than the divisor is used, and also the complement of the divisor, or the remainder after subtracting it from the round number. The first figure of the quotient is set down, from the dividend is subtracted the product of this by the round number, and to the remainder is added the product of the same figure of the quotient by the complement of the divisor. The sum is treated as a new dividend.—**Complex** or **compound division**, the division of a complex or compound number either by a number of the same sort or by an abstract number, as the division of 3 days 13 hours 17 minutes by 1 day 18 hours 28 minutes 36 seconds, or by 7.—**Direct division.** (*a*) Division not complementary. (*b*) A rule for dividing one number by another, so as to obtain the entire period of the circulating decimal of the quotient. Both dividend and divisor are multiplied by the same number so as to make the last significant figure of the divisor 9. By striking off from the divisor so multiplied the 9, together with any ciphers which may follow it, and increasing the truncated remnant by 1, a number is obtained called the current multiplier. The last figure of the multiplied dividend is now struck off, multiplied by the current multiplier, and the product added to the truncated dividend. The sum is treated as a new dividend; and this process is continued until the dividends begin to repeat themselves. The successive figures struck off from the dividend from last to first are now written down from left to right as a whole number, and subtracted from the circulating part of the same figures repeated indefinitely into the decimal places. The remainder, after shifting the decimal point as many places to the left as there were zeros struck off from the divisor along with the 9, is the quotient sought.—**Division by circulating decimals**, a method of dividing by means of a table of circulating decimals.—**Division by factors**, the process of dividing successively by factors of the divisor.—**Division by logarithms**, a method of dividing based on the fact that the logarithm of the quotient is the logarithm of the dividend diminished by the logarithm of the divisor.—**Division of a ratio**, the reduction of a proportion from $a:b = c:d$ to $b - a:a = d - c:c$.—**Division of labor**, in *polit. econ.*, the dividing up of a process or an employment into particular parts, so that each person employed can devote himself wholly to one section of the process.—**Division of the question**, in a legislative body, the division of a complex proposition or motion into distinct propositions, in order that each may be considered and voted upon separately: a course resorted to, upon motion or demand, when any of the members favor parts but not the whole of the measure. The presiding officer usually has the power of deciding whether such division is admissible.—**Division viol.** See *viol.*—**General of division.** See *general, n.*—**Golden division**†, arithmetical division not complementary.—**Harmonic division of a line.** See *harmonic*.—**Iron division**†. Same as *complementary division*.—**Logical division**, any division not a partition, being either a nominal, substantial, or accidental division.—**Long division**, the common modern method of arithmetical division when the divisor is a number larger than 10. The greatest number of times that the divisor is contained in the first figures of the dividend, beginning with the left (a sufficient number being taken to make a number greater than the divisor), is set down to the right of the dividend, as the first figure of the quotient; the divisor is then multiplied by this quotient, and the product is subtracted from the left-hand part of the dividend; to the remainder the next figure to the right in the dividend is then annexed, and the number thus formed is treated as a new dividend; and so on. The same method is extended in algebra to the division of polynomials in general. The rule is of Italian origin. See *scratch division*.—**Nominal division**, an enumeration of the different senses of an equivocal word or expression; a distinction.—**Partible division**, the mental division of a whole into its parts, as of the English nation into sovereign, lords, and commons; partition.—**Real division**, a division relating to facts, not a mere distinction between different meanings of a word, embracing substantial, partible, and accidental division; the explication of a whole by its parts.—**Scratch division**, the ordinary method of division before long division came into general use, late in the seventeenth century. The products were not set down at all, but only the remainders. The divisor was set down under the dividend; the first figure of the quotient was then set down and was multiplied by the first figure of the divisor and the remainder was set down over the corresponding figures of the dividend, which were immediately canceled, together with the first figure of the divisor. This process having been repeated until the whole divisor had been canceled, the latter was written down again one place further to the right, the second figure of the quotient was set down, and the whole proceeding repeated until a remainder was obtained less than the divisor. The following shows the successive stages of the division of 351 by 13:

```
                          2    2
      1   19  19  19  19  19   19
351 ( 351 (2 351 (2 351 (2 351 (27 351 (27
13    13    13    133   133   133
                  1     1     1
```

The rule was derived from Arabian writers.—**Short division**, a process of division practised with a divisor not larger than 10, in which the quotient is set down directly, being written from left to right, usually below a line under the dividend, without auxiliary figures.—**Substantial division**, or **division per se**, the division of a genus into its species.—**To run division**†, in *music*, to make florid variations on a theme.

do[4] (dō), *n.* [A mere syllable, more sonorous than *ut*, for which it is substituted.] In *solmization*, the syllable now commonly used for the first tone or key-note of the musical scale, and also for the tone C (as the key-note of the typical scale of the pianoforte keyboard). About 1670 it replaced the Aretinian *ut*, which is still somewhat used in France. In the tonic sol-fa system it is spelled *doh*, and indicated by its initial *d;* its significance is limited to the first tone of the scale, without reference to the keyboard. In teaching sight-singing by the help of solmization, two general methods are in use: (*a*) the *fixed-do* method, in which *do* is always applied to tones bearing the letter-name C, whether they are key-notes or not; and (*b*) the *movable-do* method, in which *do* is always applied to the key-note, whatever be its letter-name. The second method is generally regarded as the more scientific, and is far the more practical, although the first has had the support of many excellent musicians.

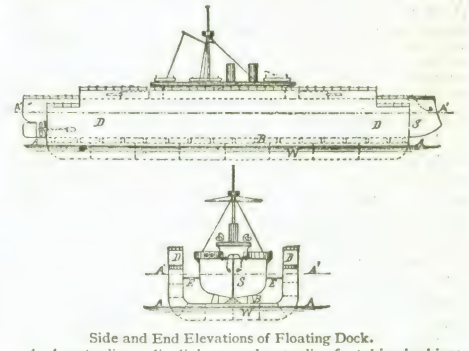
dock[3] (dok), *n.* [< MD. *docke* = D. *dok* = Flem. *dok*, a dock; cf. (from the E. or D.) Sw. *docka* = Dan. *dok*, *dokke* = G. *dock*, *docke* = F. *dock*, a dock. Origin unknown; cf. OFlem. *docke*, a cage (see *dock*[4]); Icel. *dökk*, *dökdh*, a pit, pool, = Norw. *dokk*, *dekk*, *dekt*, a hollow, low ground surrounded by hills. The word is by some connected with It. *doccia*, a canal, conduit, pipe, formerly also "a damme of a mill" (Florio), ult. < L. *ducere*, lead (see *douche*, *duct*), or with ML. *doga*, a ditch, canal, also a vessel, cup, perhaps < Gr. δοχή, a receptacle, < δέχεσθαι, receive.] In *hydraulic engin.*, strictly, an inclosed water-space in which a ship floats while being loaded or unloaded, as the space between two wharves or piers; by extension, any space or structure in or upon which a ship may be berthed or held for loading, unloading, repairing, or safe-keeping. The water-space may communicate freely with the stream or harbor, or the entrance to it may be closed by a gate or by a lock. If provided with a lock or gate, the level of the water within the dock remains at all times nearly the same, as the gate is opened only at full tide, when the level without and within is the same. If a lock is employed, vessels can pass in and out at all stages of the tide, but this does not materially affect the level of the water inside the dock. In an open dock the tide continually lowers or raises the vessel, and this interferes in some degree with the work of loading or unloading. The closed docks are free from this inconvenience, while a greater advantage is found in the absence of currents. In a larger sense the term is also applied to a basin or inclosed water-space for the storage of floating timber or the safe-keeping of river-steamers, barges, or canal-boats laid up for the winter, and by a further extension is made to include the wharves and warehouses on or in the neighborhood of a dock. The largest closed docks are at Liverpool and London, in England. In a particular sense the term is also applied to the construction and apparatus used in repairing and building ships, as the *floating dock*, *dry-dock*, *depositing-dock*, and *sectional dock*.



> The saide shippe, called the Holy Crosse, was so shaken in this voyage, and so weakened, that she was layd vp in the *docke*, and neuer made a voyage after.
> *Hakluyt's Voyages*, II. i. 98.

Depositing-dock, a caisson or an elevator for lifting vessels from the water and placing them upon stagings or wharves erected for the purpose. The lifting apparatus consists of a series of caissons or pontoons, placed side by side and joined at one end to another pontoon that, with a series of upright tubular structures, forms a girder and makes the back of a comb-like structure, of which the pontoons are the teeth. In the rear of the girder is a large floating pontoon, connected with it by two rows of heavy booms that, being pivoted at each end, serve as a series of parallel bars and keep the entire structure upright while afloat. To lift a vessel, a row of blocks with shores and chocks is arranged on top of all the pontoons. The air is allowed to escape, and the entire structure, except the float in the rear, sinks till the vessel can be floated over the pontoons. When the vessel is in position the water is pumped out of the pontoons, and they all rise together, lifting the vessel out of the water.—**Dry-dock**, a dock or an excavated basin adjoining navigable water, provided with a gate or caisson at its entrance, and so arranged that, after the entrance of a ship, the water can be exhausted from it. Such docks are long and narrow, with sloping sides

formed in steps. The method of construction is to excavate the basin in the shore, and to drive heavy piling along the bottom and under the sloping sides and rear end. Upon the piles is built up a tub-like structure of concrete with a partial or complete interior lining of stone or brick. A less durable form of construction in wood is sometimes adopted, in which heavy timbers are used to form the floor and the steps at the sides, the wall outside the side timbers being formed by clay puddle filled in among the side piles supporting the timbers. At the entrance are double gates opening outward, and meeting at an angle when closed, to resist the pressure of the water on the outside when the dock is empty. The modern method of closing a dry-dock is by means of a floating gate or caisson, which is floated into position across the entrance and loaded with water-ballast till it sinks, fitting tightly by a keel into a groove in the gateway. To use the dock, the gate is opened, or floated away at high water, and the ship is drawn into the dock and held afloat over a line of blocks along the center of the dock. The gate is then put in position, and sunk till the dock is closed water-tight. The water within the dock is then exhausted by steam-pumps, leaving the ship supported on the blocks, and braced on both sides by shores extending to the dock-steps.—**Floating dock**, a capacious wooden or iron structure, generally rectangular, intended to serve as a graving-dock. Floating docks are built in water-tight compartments, and can be sunk to the required

depth by the admission of water into these compartments. When the vessel is docked, the floating dock is raised by pumping, till its bottom touches the keel of the ship. Shores are then added to keep the ship in position, and the dock is raised higher. Instead of compartments, water-tight tanks are occasionally used, and the dock is raised and

lowered on the same principle. A floating dock may also be made so heavy as to sink by its own weight deep enough to receive the largest vessel, and be raised by means of empty water-tight tanks, which lift dock and ship by their buoyancy.—**Graving-dock**, a dry-dock: so called because used in graving or cleaning the bottom of ships. The graving-docks in the navy-yards of Brooklyn, Boston, and Norfolk are important examples.—**Half-tide dock**, a basin connecting two or more docks, and communicating with the entrance-basin.—**Sectional dock**, a floating dock composed of a succession of pontoons or caissons attached to a platform below the vessel. Steam-pumps are used to remove the water from the caissons, and, as they float, the vessel is raised.

See *probability*.—**Doctrine of correspondences.** See *correspondence*.—**Doctrine of cy-pres.** See *cy-pres*.—**Doctrine of definite proportions.** See *atomic theory*, under *atomic*.—**Doctrine of enumerated powers.** See *enumerate*.—**Doctrine of occasional causes.** See *occasional*.—**Monroe doctrine**, in American politics, the doctrine of the non-intervention of European powers in matters relating to the American continent. It received its name from statements contained in President Monroe's annual message to Congress in December, 1823, at the period of a suspected concert of the powers in the Holy Alliance to interfere in Spanish America in behalf of Spain. The following are the most significant passages in the message: "We could not view an interposition for oppressing them [the Spanish-American republics] or controlling in any other manner their destiny by any European power, in any other light than as a manifestation of an unfriendly disposition toward the United States." "The American continents should no longer be subjects for any new European colonial settlement."

The only thing which the *Monroe Doctrine* really contains is the intimation on the part of the United States of a right to resist attempts of European Powers to alter the constitutions of American communities.
G. P. Fisher, Outlines of Universal Hist., p. 602.

=**Syn. 1.** *Precept*, *Doctrine*, *Dogma*, *Tenet*. *Precept* is a rule of conduct, generally of some exactness, laid down by some competent or authoritative person, and to be obeyed; it differs from the others in not being especially a matter of belief. (See *principle*.) *Doctrine* is the only other of these words referring to conduct, and in that meaning it is biblical and obsolescent. In the Bible it refers equally to teaching as to the abstract truths and as to the duties of religion: "In vain they do worship me, teaching for *doctrines* the commandments of men." (Mat. xv. 9.) As distinguished from *dogma* and *tenet*, *doctrine* is a thing taught by an individual, a school, a sect, etc., while a *dogma* is a specific doctrine formulated as the position of some school, sect, etc., and pressed for acceptance as important or essential. *Dogma* is falling into disrepute as the word for an opinion which one is expected to accept on pure authority and without investigation. *Tenet* is a belief viewed as held, a doctrinal position taken and defended. It is equally applicable to the beliefs of an individual and of a number; it has no unfavorable sense.

faces of an ordinary icosahedron. It has 12 faces, 12 summits, 30 edges, 5 sides per face, and 5 edges per summit. The form approximating most closely to it is the pentagonal dodecahedron, or the pyritohedron, in which the faces are five-sided, but not regular pentagons.—**Regular dodecahedron,** in *geom.*, a dodecahedron whose faces are all regular polygons, and whose summits are all regular solid angles. It has 12 faces, 12 summits, 30 edges, 5 edges per face, and 5 edges per summit. The succession of faces about a summit goes round the summit once, the succession of vertices around a face goes round the center of the face twice, and the center of the solid is twice inclosed.—**Truncated dodecahedron,** a dyocætriacontahedron formed by cutting off the faces of the regular dodecahedron parallel to those of the coaxial icosahedron so as to leave the former decagons. It is one of the thirteen Archimedean solids.

dodo (dō′dō), *n.* [< Pg. *doudo*, a dodo, < *doudo, doido*, a simpleton, a fool, < *doudo, doido*, adj., simple, foolish. According to Diez, this word, which is unknown in Spanish, came from England (?): E. dial. (Devon) *dold*, stupid, confused: see *dolt.* Cf. *booby*, a bird so named for a similar reason. The bird was also named by the Dutch (1) *walgh-vogel*, now *walg-vogel*, lit. 'nauseous bird'; also (2) *dod-aers*, lit. 'dead-arse,' "propter fœdam posterioris partis crassitiem" (note dated 1626), or because of some resemblance to the dabchick or little grebe, which was also so called; also (3) *dronte* (> Dan. *dronte* = Sw. *dront*); origin unknown. The NL. name is *didus*, Sp. *dido*: see *Didus.*] A recently extinct bird of Mauritius, *Didus ineptus*, the type of the family *Dididæ* and suborder *Didi*, now usually assigned to the order *Columbæ*. The dodo was living in Mauritius on the discovery of that island by the Portuguese under Mascarenhas in the beginning of the sixteenth century, and it is known to have survived until July, 1681. Knowledge of the bird was for some time confined to the quaint and often questionable narratives of voyagers, certain pictures, mostly by Dutch artists, and a few fragmentary remains. In 1866 bones in abundance were found, and the osseous structure has been described in detail. The dodo was a massive, clumsy, flightless, and defenseless bird, about as large as a swan, covered with downy feathers, with a very stout hooked bill, short strong legs, short tail, and wings too small for flight; so that it soon succumbed under the new conditions which the occupation of the island introduced, its extinction being probably due as much to the animals which man introduced as to the human invaders of the island. The solitaire (*Pezophaps solitarius*) of Rodriguez, an island of the same group, was similar to the dodo, but sufficiently distinct to be placed in a different genus. (See *solitaire.*) The neighboring island of Réunion or Bourbon also had a dodo, in all probability a third kind.

Dodo (*Didus ineptus*).
From a painting in the Belvedere, Vienna.

You shall receue . . . a strange fowle: which I had at the Iland Mauritius called by ye Portingalls a *Do Do:* which for the rareness thereof I hope wilbe welcome to you. *Emanuel Altham*, letter written in 1628.

[This is the earliest known English mention of the bird.]

The *Dodo* comes first to a description: here and in Dygarrois [Rodriguez] (and no where else, that I ever could see or heare of) is generated the *Dodo* (a Portuguize name it is, and has reference to her simpleness), a Bird which for shape and rareness might be call'd a Phœnix (wer 't in Arabia). *Sir T. Herbert*, Travels (ed. 1638).

Recent excavations on the site have brought to light a rich collection of works of art, particularly of small bronzes, and a large number of inscriptions, many of them on leaden plates. Also written *Dodonaian, Dodonian.*

Hence in comp. *bandog*, *bulldog*, etc.] **1.** A quadruped of the genus *Canis*, *C. familiaris*. The origin of the dog is a question most difficult of solution. Some think the breed is derived from the wolf, others affirm it to be from a familiarized jackal; all agree that no trace of it is to be found in a primitive state, the dhole of India and the dingo of Australia being wild descendants from domesticated ancestors. The view now generally taken by naturalists is that the dog is neither a species, in the zoölogical sense, nor even the descendant of any one species modified by domestication, but that the dogs of different parts of the world have a correspondingly various ancestry, from different wild species of the genus *Canis*, as wolves, foxes, and jackals. This view is supported not only by the enormous differences between dogs, but also by the readiness with which nearly all dogs cross with their wild relatives; and, accordingly, the name *Canis familiaris* is a conventional rather than a proper zoölogical designation of the dog as a species. No satisfactory classification of the different kinds of dogs has been arrived at, what some naturalists regard as types being regarded by others as mere mongrels. An old classification grouped dogs in three classes, the *Celeres*, *Sagaces*, and *Pugnaces*. Colonel Hamilton Smith groups the domestic dog into six sections: (1) the *wolf-dogs*, including the Siberian, Eskimo, Newfoundland, Great St. Bernard, sheep-dog, etc.; (2) *watch-* and *cattle-dogs*, including the German boar-hound, Danish dog, dog of the North American Indians, etc.; (3) the *greyhounds*, as the different kinds of greyhound, Irish hound, lurcher, Egyptian street-dog, etc.; (4) the *hounds*, as the blood-hound, staghound, foxhound, harrier, beagle, pointer, setter, spaniel, springer, cocker, Blenheim dog, poodle, etc.; (5) the *curs*, including the terrier and its allies; (6) the *mastiffs*, including the different kinds of mastiff, bulldog, pug-dog, etc. All these are artificial varieties, having comparatively little stability, their distinctive characters being soon lost by reversion to a more generalized type if they are left to interbreed. This tendency to reversion requires to be constantly counteracted by "artificial selection" at the hands of breeders, in order that the several strains may be kept pure, and their peculiarities be perpetuated along the desired lines of specialization. The best-bred dogs, of whatever kind, are those furthest removed from an original or common type of structure. The differences between dogs of all kinds are vastly greater than those found among individuals of any species in a state of nature; so great that, were they not known to be artificial, the dog would represent several different genera of the family *Canidæ* in ordinary zoölogical classification. In fact, some genera, based upon actual and constant differences in the dental formula, have been named in order to signalize certain structural modifications which are found to exist, affording an example of the evolution of generic characters as well as of specific differences. These variations extend not only to size and general configuration, character of the pelage, and other outward features, but also to positive osteological and dental peculiarities, more marked probably than those of any other domesticated animals. The corresponding physiological and psychological differences are equally decided, as witnessed in the dispositions and temperaments of dogs, their comparative docility, intelligence, etc., and consequently the uses to which they are or may be put. In the matter of size alone, for example, some toy dogs are tiny enough to stand easily on one of the fore paws of a large dog. Throughout the endless varieties, however, the influence of heredity is witnessed in the readiness with which dogs interbreed with one another, and cross with wolves, foxes, and jackals, bearing fertile progeny in all cases, and the readiness with which they revert to the wild state of their several ancestors. See the names of the several breeds. See also *Canidæ* and *Canis*.

Now is a *dogge* also dere that in a dych lygges.
Alliterative Poems (ed. Morris), ii. 1792.

Many pretty ridiculous aspersions are cast vpon *dogges*, so that it would make a *dogge* laugh to heare and vnderstand them: as, I haue heard a man say, I am as hot as a *dogge*, or, as cold as a *dogge;* I sweat like a *dogge* (when indeed a *dogge* never sweats); as drunke as a *dogge;* hee swore like a *dogge;* and one told a man once that his wife was not to be beleev'd, for shee would lye like a *dogge*.

Eskimo dog, one of a breed of dogs extensively spread over the northern regions of America and of eastern Asia. It is rather heavier than the English pointer, but appears smaller on account of the shortness of its legs. It has oblique eyes, an elongated muzzle, and a bushy tail, which characteristics give it a wolfish appearance. The color is generally a deep dun, obscurely barred and patched with a darker color. It is the only beast of burden in arctic latitudes, and with a team of such dogs attached to his sledge the Eskimo can travel 60 miles a day for several successive days.—**Field-dog,** a dog used for the pursuit of game in the field. In the United States the term is commonly applied to pointers and setters.—**Hunting-dog.** (*a*) A dog used for hunting. (*b*) The painted hyena or cynhyene. Another breed is smaller and almost entirely black. Some breeds seem to be crossed with hounds, mastiffs, etc. The Newfoundland dog is remarkable for its sagacity, patience, and good nature, and for its affection for its master. No dog excels it as a water-dog, its broad half-webbed paws making it an excellent and powerful swimmer.—**Pouched dog,** a marsupial, the thylacine dasyure of Tasmania. But he also says the sun was then entering Leo, which rule, making the dog-days begin July 23d, has also been used. Hippocrates (450 B. C.) says they were in the hottest and most unhealthy part of summer. If the season was of Babylonian origin, it would originally probably have been in early summer. Perhaps they are now most usually reckoned from July 3d to August 11th, inclusive.

In Genoa the dignity was established in the fourteenth century; the doge was at first elected for life, but from the first part of the sixteenth century the term was restricted to two years, and the authority of the doge became more limited. The office disappeared in Venice in 1797, at the overthrow of the republic, and in Genoa in the same year, although there was a temporary restoration of it in the latter city a few years later.

This name as used by Continental geologists is the equivalent of that part of the Jurassic series which corresponds to the Lower Oölite of the English geologists. It is the Brown Jura of the Germans, and is there divided into three groups, distinguished by their fossil remains.
